312 Negro population in the United States, 1790-1915. Arno Press
and The New York Times 1968

844p maps (The American Negro, his history and literature)

Reprint of the 1918 edition. Facsimile title page added.

A statistical guide to the Negro population prior to 1915. Taken from
published and unpublished census returns, the material provides information
on employment, education, mortality rates and the other vital statistics

Compiled by John Cummings.

THIS STATISTICAL VOLUME IS AN INDISPENSABLE GUIDE FOR anyone doing research in the history of black Americans before 1915. Compiled from published and unpublished census returns, its data provides a wealth of information on every facet of Negro life susceptible to statistical study. Detailed population figures, comparative mortality rates for Negroes and whites, statistics on education, illiteracy, property ownership, employment and occupations—all these and more can be found in abundance in this book. It is carefully arranged and tabulated for ease of research. Data on the white population is also included, where needed, to provide a comparative context and give the statistics on Negroes a wider perspective.

The history of Negroes in America is divided into four major epochs; the colonial and revolutionary period (1619–1789); slavery in the United States (1790–1865); the first two generations of freedom (1865–1915); and the two generations since the beginning of the massive northward migration in 1915. The following 840 pages contain the raw material for an understanding of the two middle epochs, and can be used as a guide to further information found in the census reports themselves. Every library, and every individual interested in Negro history, should own a well-thumbed copy of this volume.

James M. McPherson

DEPARTMENT OF HISTORY
PRINCETON UNIVERSITY

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data. The second part of the document provides a detailed breakdown of the financial data, including a list of all accounts and their respective balances. It also includes a summary of the total assets and liabilities, which shows that the organization is in a strong financial position. The final part of the document concludes with a statement of the overall financial health and a recommendation for future actions. It suggests that the organization should continue to monitor its financial performance closely and make adjustments as needed to ensure long-term success.

CONTENTS.

SUMMARY OF CHAPTERS.

	Page.
INTRODUCTION.....	17
PART I.—GROWTH AND GEOGRAPHIC DISTRIBUTION: 1790-1910.	
CHAPTER I.—The states and outlying possessions	21
CHAPTER II.—Growth in the states: 1790-1910—Number, increase, and proportion of Negroes in the total population	24
CHAPTER III.—Geographic distribution and increase, by states: 1790-1910.....	31
CHAPTER IV.—Proportion Negro in the population at each census, by states: 1790-1910.....	46
CHAPTER V.—Free colored and slave population: 1790-1860.....	53
PART II.—MIGRATORY DISPLACEMENT AND SEGREGATION.	
CHAPTER VI.—Nativity—Place of birth, parentage, and interstate migration.....	61
CHAPTER VII.—Urbanization—Urban and rural classification, and population of cities.....	87
CHAPTER VIII.—The "black belt"—Number, increase, and density, by county areas.....	108
PART III.—PHYSICAL CHARACTERISTICS.	
CHAPTER IX.—Sex composition.....	147
CHAPTER X.—Age composition.....	158
CHAPTER XI.—Color—Black and mulatto elements.....	207
PART IV.—VITAL STATISTICS.	
CHAPTER XII.—Marital condition.....	235
CHAPTER XIII.—Fertility—Proportion of children to women of childbearing age.....	283
CHAPTER XIV.—Mortality in the registration area.....	298
PART V.—EDUCATIONAL AND SOCIAL STATISTICS.	
CHAPTER XV.—School attendance.....	375
CHAPTER XVI.—Illiteracy.....	403
CHAPTER XVII.—The delinquent, defective, and dependent classes.....	436
PART VI.—ECONOMIC STATISTICS.	
CHAPTER XVIII.—Home ownership, and size of families.....	459
CHAPTER XIX.—Occupation—Employments, trades, and professions, by industrial groups.....	502
CHAPTER XX.—Negro agriculture—Acreage of farms; value of farm property; live stock; crops; term of occupancy; mortgage indebtedness; and tenure classes.....	552
PART VII.—GENERAL TABLES.	
TABLE I.—Statistics of Negro population for cities and towns of 2,500 inhabitants or more: 1910.....	767
TABLE II.—Negro population, 1910, 1900, 1890, 1880, decennial increases, proportion Negro, land area, and Negro population per square mile, by counties, for Southern states.....	776
TABLE III.—General statistics of the Negro population of the United States, by counties: 1910.....	798
TABLE IV.—Total population at each census, by divisions and states: 1790-1910.....	840

CONTENTS OF CHAPTERS.

INTRODUCTION.

	Page.
Sources and scope of compilations	17
Detail of tabulations for different years.....	17
Reorganization of material.....	18
Emancipation and social progress.....	18

PART I.—GROWTH AND GEOGRAPHIC DISTRIBUTION: 1790-1910.

CHAPTER I.—THE STATES AND OUTLYING POSSESSIONS.

	Page.
Negro population and increase: 1900-1910.....	21
Negro and other racial classes: 1910.....	21
Increase, by classes: 1900-1910.....	22
Proportion Negro: 1910 and 1900.....	22
Black and mulatto population: 1910.....	22
Nativity and parentage: 1910.....	23

CHAPTER II.—GROWTH IN THE STATES: 1790-1910—NUMBER, INCREASE, AND PROPORTION OF NEGROES IN THE TOTAL POPULATION.

Population and increase, by classes: 1900-1910.....	24
Negro, white, and other population at each census: 1790-1910.....	25
Diagram I.—Negro and white population at each census: 1790-1910.....	26
Fluctuation in the rates of increase.....	25
Diagram II.—Decennial increase of the Negro population: 1790-1910.....	26
Diagram III.—Decennial percentage increase of the Negro and of the white population: 1790-1910.....	26
The undercount of 1870.....	26
The undercount of 1890.....	27
Increase affected by extension of area.....	28
Revised figures of increase: 1790-1910.....	28
Increase by 30, 50, and 60 year periods: 1790-1910.....	29

CHAPTER III.—GEOGRAPHIC DISTRIBUTION AND INCREASE, BY STATES: 1790-1910.

Areas.....	31
Racial classes, by sections and divisions: 1910.....	31
Diagram I.—Color, nativity, and parentage of the population, by divisions: 1910.....	33
Negro and white population, by sections and divisions: 1790-1910.....	32
Negro and white increase, by sections and divisions: 1790-1910.....	34
Negro and white population, by states: 1790-1910.....	35
Diagram II.—Negro population, by states: 1910 and 1900.....	36
Negro and white increase, by states: 1790-1910.....	36
Table 7.—Negro and white increase, by divisions and states: Decennial, 1900-1910, and by 30-year periods, 1790-1910.....	37

CHAPTER III.—GEOGRAPHIC DISTRIBUTION AND INCREASE, BY STATES: 1790-1910—Continued.

	Page.
Negro and foreign-born white population: 1900-1910.....	39
Density of Negro and white population, total and rural: 1910.....	40
Geographic center of the Negro population.....	40
Map.—Center of Negro population: 1790 and 1880 to 1910.....	42

GENERAL TABLE.

Table 13.—Population by states: Negro and white, at each census, 1790-1910; Indian and other, 1910 and 1900.....	43
--	----

CHAPTER IV.—PROPORTION NEGRO IN THE POPULATION AT EACH CENSUS, BY STATES: 1790-1910.

Percentage distribution, by racial classes, for sections and divisions: 1910.....	46
Percentage Negro, and Negroes to 1,000 whites, by sections and divisions: 1790-1910.....	46
Percentage Negro at each census, by states: 1790-1910.....	49
Map.—Percentage Negro in the population, by states: 1910.....	47
Diagram I.—Percentage Negro in the population of the Southern states at each census: 1790-1910.....	48
Negroes to 100,000 whites at each census, by states: 1790-1910.....	49

GENERAL TABLES.

Table 5.—Percentage Negro in the population at each census, by divisions and states: 1790-1910.....	51
Table 6.—Number of Negroes to 100,000 whites, at each census, by divisions and states: 1790-1910.....	52

CHAPTER V.—FREE COLORED AND SLAVE POPULATION: 1790-1860.

Number and increase: 1790-1860.....	53
Distribution by sections and southern divisions: 1790-1860.....	55
Free and slave population of four cities: 1790.....	55
Slaveholding and nonslaveholding families: 1790 and 1850.....	56

GENERAL TABLE.

Table 6.—Negro population, slave and free, at each census, by divisions and states: 1790-1860.....	57
--	----

PART II.—MIGRATORY DISPLACEMENT AND SEGREGATION.

CHAPTER VI.—NATIVITY—PLACE OF BIRTH, PARENTAGE, AND INTERSTATE MIGRATION.

The nativity inquiry.....	61
Native and foreign born: 1850-1910.....	61
Parentage: 1910 and 1900.....	62
Country of birth.....	63

CHAPTER VI.—NATIVITY—PLACE OF BIRTH, PARENTAGE, AND INTERSTATE MIGRATION—Continued.

Native population reporting state of birth.....	63
Classification by state of birth: 1850.....	63
Population born in the South: 1870-1910.....	64
Migration from and to the South.....	65

PART II.—MIGRATORY DISPLACEMENT AND SEGREGATION—Continued.

CHAPTER VI.—NATIVITY—PLACE OF BIRTH, PARENT-AGE, AND INTERSTATE MIGRATION—Continued.

	Page.
Proportion of migrants in the South and in the North and West.	66
Intersectional migration.	66
Table 14.—Migration of Negroes out of and into the South: 1870-1910.	68
Interdivisional migration.	69
Interstate migration.	70
Table 17.—Negroes born in each state, with number and percentage living in other states, and Negroes living in each state, with number and percentage born in other states: 1910 and 1900.	71
Interstate migrants in urban communities.	73
Table 19.—Migrants and immigrants in Negro and white population of cities of 50,000 or more inhabitants, having 5,000 or more Negroes: 1910.	74

GENERAL TABLES.

Table 20.—Native Negro population, classified according to division and state in which born, by divisions and states: 1910.	75
Table 21.—Negro population born in each state, distributed according to selected states of residence: 1910.	80
Table 22.—Negro population of each state, classified as native and foreign born, and the native population distributed according to selected states of birth: 1910.	83

CHAPTER VII.—URBANIZATION—URBAN AND RURAL CLASSIFICATION AND POPULATION OF CITIES.

Population, urban and rural, and in classes of cities, by racial classes: 1910.	87
Racial composition of the urban and rural population: 1910, 1900, and 1890.	88
Urban and rural increase: 1890-1910.	89
Sections and southern divisions.	89
Diagram I.—Percentage urban and rural in the Negro and white populations, by sections: 1910.	90
Diagram II.—Percentage urban and rural in the Negro population, by sections: 1910, 1900, and 1890.	91
The states.	91
Table 9.—Negroes in urban and rural communities, by divisions and states: 1910, 1900, and 1890.	92
Urban communities.	93
Diagram III.—Negro population in cities having 100,000 population or more and a Negro population of more than 1,000: 1910 and 1900.	94

CHAPTER VII.—URBANIZATION—URBAN AND RURAL CLASSIFICATION AND POPULATION OF CITIES—Con.

	Page.
Wards of cities.	94
Characteristics of urban communities.	94

GENERAL TABLES.

Table 12.—Negro population of urban communities: 1910 and 1900.	95
Table 13.—Negro population by wards or equivalent subdivisions of cities having 50,000 or more inhabitants of whom at least 5,000 are Negroes: 1910.	105
CHAPTER VIII.—THE "BLACK BELT"—NUMBER, INCREASE, AND DENSITY, BY COUNTY AREAS.	
The county as a unit area of compilation.	108
Classification of counties by Negro population: 1910.	108
Area of relatively high density: 1910.	109
Map I.—Negro population per square mile, by counties: 1910.	110
Area of increasing, decreasing, and stationary Negro population: 1900-1910.	111
Map II.—Percentage increase or decrease of the Negro population, by county areas, for Southern states (exclusive of Oklahoma): 1900-1910.	113
Maps III-VI.—Southern counties in which the proportion Negro in the population was 50 to 75 per cent and over: 1910, 1900, 1880, and 1860.	115
Table 4.—Area of counties and number and increase of Negro population, classified by percentage of increase of county population, 1900 to 1910, by southern divisions and states.	116
Proportion Negro in the population, by counties.	124
The "black belt" counties.	125
Area of specific proportion Negro in the population: 1880-1910.	127
Increase and proportion Negro, by counties.	127
Proportion Negro and density of Negro population.	130
Area of increasing and decreasing proportion Negro: 1900-1910.	131
Map VII.—Counties having at least 1,000 Negroes in 1910 and a percentage Negro in the population higher in 1910 than in 1900.	133

GENERAL TABLE AND STATE MAPS.

Table 13.—Percentage Negro and number of Negroes per 1,000 whites for the 264 counties having a population at least 50 per cent Negro in 1910, by states.	134
Maps VIII-XXII.—Percentage Negro in the population of Southern states, by counties: 1910.	136-143

PART III.—PHYSICAL CHARACTERISTICS.

CHAPTER IX.—SEX COMPOSITION.

Negro males and females at each census: 1820-1910.	147
Sex ratio by classes.	148
Sex ratio of Negro and white population.	148
Sex composition of Negro population, by states: 1910, 1900, 1890, and 1880.	149
Table 5.—Number of males and females and ratio of males to females in the Negro population, by divisions and states: 1910, 1900, 1890, and 1880.	150
Table 6.—Negro population cumulated by states, ranged in order by sex ratio: 1910, 1900, and 1890.	151
Sex ratio in the "black belt".	151

CHAPTER IX.—SEX COMPOSITION—Continued.

Urban and rural population.	152
Table 14.—Urban and rural population classified by sex, with sex ratio and percentage urban, by divisions and states: 1910.	155
Principal cities.	153
Table 15.—Negro males and females, and males to 1,000 females, for cities of 100,000 inhabitants and over: 1910, 1900, and 1890; and males to 1,000 females in classes of the white population: 1910.	156
Table 16.—Negro males and females, and males to 1,000 females, for cities of 25,000 to 100,000 inhabitants: 1910.	157

PART III.—PHYSICAL CHARACTERISTICS—Continued.

CHAPTER X.—AGE COMPOSITION.

	Page.
The age inquiry	158
Value of age statistics	158
Returns by single years of age: 1910 and 1900	159
Table 2.—Negro population classified by sex and single years of age, and number in each year of age per 100,000 under 1 year: 1910 and 1900	161
Diagram I.—Negro population classified by sex and single years of age with excess of males or females at each age: 1910	163
Number in each age per 100,000 under 1 year	162
Centenarians	162
Distribution by quinquennial age periods: 1910 and 1900	164
Increase by quinquennial age periods: 1900-1910	164
Age distribution at each census: 1820-1910	167
Table 4.—Negro population in years specified, classified by sex and age periods: 1830-1910	166
Sex distribution by age	167
Diagram II.—Deficiency or excess of males per 1,000 females by age periods, in the Negro population: 1910	168
Age distribution by racial classes	169
Table 11.—Distribution by cumulative age periods of the Negro population of known age, and of classes of the white population, by sex: 1910, 1900, and 1890	171
Percentage Negro by age periods: 1910 and 1900	172
Median age: 1820-1910	172
Population of sections and divisions classified by age	173
Population of states classified by age	178
Table 20.—Percentage distribution, by broad age periods, of the Negro population and of classes of the white population, by Southern states: 1910 and 1900	177
Table 21.—Median age by states, of the Negro population: 1910 and 1900; and of the Negro, Indian, and Mongolian population: 1890 and 1880	178
Urban and rural population classified by age	181
Population of classes of cities classified by age	186
Population of individual cities classified by age	188
Population 21 years of age and over	189
Males of militia age	191

GENERAL TABLES.

Table 37.—Negro population classified by age periods, by sections, southern divisions, and Southern states: 1910 and 1900	192
Table 38.—Negro males and females under 25 years of age classified by single years of age, by Southern states: 1910	193
Table 39.—Negro males and females classified by quinquennial age periods, by divisions and states: 1910	194
Table 40.—Percentage distribution by age periods of urban and rural Negro and white population classes, by Southern states: 1910	197
Table 41.—Urban and rural Negro population classified by age periods, by states: 1910	199
Table 42.—Negro males and females 21 years of age and over, Negro males 21 years and over in urban and rural communities, and Negro males of militia age (18 to 44 years), by divisions and states: 1910	200

CHAPTER X.—AGE COMPOSITION—Continued.

GENERAL TABLES—continued.

	Page.
Table 43.—Negro males and females classified by age periods, by cities having 100,000 inhabitants or more: 1910	201
Table 44.—Negro males and females classified by age periods, by cities of 25,000 to 100,000 inhabitants having a Negro population of 1,000 or more: 1910	204
Table 45.—Negro males and females classified by broad age periods, by cities having 10,000 to 25,000 inhabitants and a Negro population of 1,000 or more: 1910	206

CHAPTER XI.—COLOR—BLACK AND MULATTO ELEMENTS.

Significance of the terms "black" and "mulatto"	207
Proportion mulatto: 1850-1910	208
Increase of the black and mulatto elements: 1850-1910	210
Proportion mulatto, by sex: 1910, 1870, and 1860	211
Proportion mulatto, by age: 1910	212
Proportion of children in the black and mulatto population	213
Proportion mulatto in the urban and rural population	213
Classes of urban communities	213
Black and mulatto population of individual cities	214
School attendance of black and mulatto children	215
Illiteracy of blacks and mulattoes	217

GENERAL TABLES.

Table 22.—Negro population classified as black and mulatto, by divisions and states: 1910, 1890, and 1870	218
Table 23.—Increase in black and mulatto population, by divisions and states: 1870-1890, 1890-1910, and 1870-1910	219
Table 24.—Black and mulatto population, free and slave, classified by sex, by divisions and states: 1860	220
Table 25.—Black and mulatto population, free and slave, by divisions and states: 1850	221
Table 26.—Black and mulatto population classified by sex, with excess of males or females, and sex ratio, by divisions and states: 1910	222
Table 27.—Negro population, black and mulatto, classified by sex and age periods, with percentage mulatto, by sections and southern divisions: 1910	223
Table 28.—Negro population, black and mulatto, classified by sex and age periods, with percentage mulatto, by Southern states: 1910	224
Table 29.—Urban and rural black and mulatto population, classified by sex, by divisions and states: 1910	227
Table 30.—Percentage mulatto in the urban and rural Negro population, and percentage urban, and males to 1,000 females in the urban and rural black and mulatto population, by divisions and states: 1910	228
Table 31.—Negro population distinguished as black and mulatto, in cities having 5,000 Negroes or more: 1910	229
Table 32.—School attendance of the black and mulatto population—Number in school and not in school, by age periods, by sections, southern divisions and states: 1910	230
Table 33.—Illiteracy in the black and mulatto population 10 years of age and over, classified by sex, and for males 21 years of age and over: 1910	231

PART IV.—VITAL STATISTICS.

CHAPTER XII.—MARITAL CONDITION.

	Page.
Marital condition classes.....	235
Accuracy of data.....	235
Marital condition: 1910, 1900, and 1890.....	235
Comparison with other racial classes.....	237
Sex ratio by marital condition.....	238
Marital condition by age periods.....	238
Diagram I.—Percentage single, married, and widowed, for Negro males and females, by age periods: 1910.....	240
Diagram II.—Number single and number married, widowed, or divorced, for Negro males and females, by age periods: 1910.....	242
Diagram III.—Percentage married, widowed, or divorced, for Negro males and females, by age periods: 1910, 1900, and 1890.....	242
Diagram IV.—Percentage single, and percentage married, widowed, or divorced, for Negroes and for native whites of native parentage, by sex and age periods: 1910.....	242
Diagram V.—Percentage married, for Negroes and for native whites of native parentage, by sex and age periods: 1910.....	242
Diagram VI.—Percentage widowed, for Negroes and for native whites of native parentage, by sex and age periods: 1910.....	243
Marital condition by single years of age for the ages 15 to 34 years.....	243

LETTER OF TRANSMITTAL.

DEPARTMENT OF COMMERCE,
BUREAU OF THE CENSUS,
Washington, D. C., June 5, 1918.

SIR:

I transmit herewith a report on the Negro population of the United States, prepared by Dr. John Cummings in the Division of Revision and Results, under the general supervision of Dr. Joseph A. Hill. This report is based upon publications, schedules, and manuscript tables of this bureau and covers a period of 125 years, from 1790 to 1915. I believe, therefore, that it is the most comprehensive statistical report ever published on the subject to which it relates, and I feel confident that it will prove to be a very valuable source of information regarding the progress of the Negro race in this country.

It is worthy of note that the tabulations for this report were made by a corps of Negro clerks working under the efficient direction of three men of their own race, namely, Robert A. Polham, Charles E. Hall, and William Jennifer.

Respectfully,

SAM. L. ROGERS,
Director of the Census.

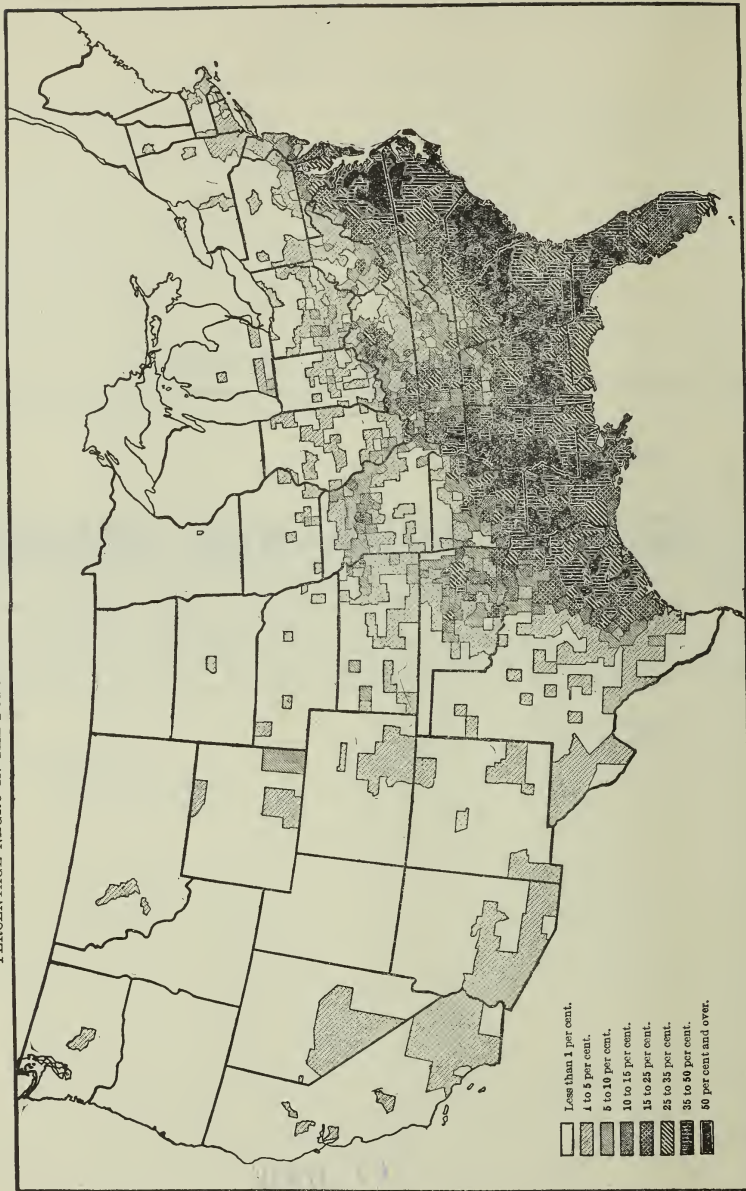

HON. WILLIAM C. REDFIELD,
Secretary of Commerce.

NEGRO POPULATION: 1790-1915

(15)

17 680

PERCENTAGE NEGRO IN THE POPULATION OF THE UNITED STATES, BY COUNTIES, 1910.

NEGRO POPULATION: 1790-1915.

By JOHN CUMMINGS, Ph. D.,
Expert Special Agent, Bureau of the Census.

INTRODUCTION.

SOURCES AND SCOPE OF COMPILATIONS.

Statistics relating to the Negro population have been compiled in the present report from publications, schedules, and unpublished manuscript tables of the Census Bureau, covering the period of 125 years from 1790 to 1915. In part, therefore, the tabulations of the report are compilations which assemble and reorganize material previously published, and in part they are entirely original from records, manuscripts, and schedules.

Voluminous and fugitive records of a century and a quarter are summarized in these compilations, which in the aggregate present a statistical account of the Negro population, covering its racial experience under the conditions imposed by slavery and under the no less difficult conditions imposed by emancipation and freedom.

Specifically this statistical account comprehends the growth of the Negro population from decade to decade; its geographical distribution at each decennial enumeration; its migratory drift westward in the early decades of the last century, when Negroes and whites were moving forward into the East and West South Central states as cultivators of virgin soil; its drift northward and cityward, and in more recent decades southward out of the "black belt," in response to the universal gravity pull of complex economic and social forces; its widespread dispersion on the one hand, and on the other its segregation with reference to the white population; its sex and age composition and marital condition; its fertility, as indicated by the proportion of children to women of childbearing age in different periods—again, under social conditions varying from the irresponsible relations of slavery to the more exacting institutions of freedom; its intermixture with other races, as shown by the increase in the proportion mulatto; its annual mortality in the registration area; its educational progress since emancipation, in so far as this can be measured by elementary schooling and by increasing literacy; its criminality, dependency, and physical and mental de-

generacy which Negroes manifest in common with other racial classes in all civilized communities; finally, its economic progress, as indicated by increasing ownership of homes, by entrance into skilled trades and professions, and primarily and fundamentally by the rapid development of Negro agriculture.

Entirely new compilations have been made from manuscript tables and directly from schedules and records, relating especially to mortality, ownership of homes, and agriculture. The rapid development of Negro agriculture, as demonstrated in the statistics which show an increasing acreage and value for Negro farms, and an increasing value of live stock, crops, and farm property on such farms, seems extremely significant. This progress has provided a substantial basis for general social improvement in the recent past, and it is a sure guaranty of further improvement in the future.

DETAIL OF TABULATIONS FOR DIFFERENT YEARS.

As is true in the case of the white population, the statistics of the Negro population in the decennial census reports have tended to become, from census to census, more comprehensive and detailed, not only as regards diversity of topics covered by schedule inquiries, but also as regards completeness of compilation of the returns.

At the earlier censuses, returns relating to the slave and to the free colored population were generally restricted to a few simple inquiries. At the census of 1790, for example, the number of slaves was ascertained without distinction of either sex or age, and at each of the five succeeding censuses, 1800-1840, age was recorded for Negroes, free and slave, in less detail than for whites. At the censuses of 1850 and 1860, also, the returns for the slave population, which were made upon special schedules, were less detailed than were those secured for the free colored and white population. In 1870, however, since all Negroes were free, the returns for the total Negro population were made upon the schedule provided for all free inhabitants, and at this census as at each suc-

ceeding census they were made in the same detail for Negroes as for whites.

It is true generally, also, that in the published population reports of the census, beginning with that of 1870, so far as the schedule inquiries are applicable to Negroes, practically the same detail is shown for Negroes as for whites.

REORGANIZATION OF MATERIAL.

The compilations for Negroes of the returns at the census of 1910 are in fact scattered through the seven quarto volumes constituting the general report of the Thirteenth Census on Population, Occupations, and Agriculture, averaging more than a thousand pages per volume. Similarly, for other census years, also, returns relating to Negroes are scattered through volumes of general reports. Data relating to mortality of Negroes in the registration area are contained in the annual mortality reports compiled by the Bureau of the Census, which constitute a series of publications entirely separate from the reports of the decennial census.

It will be apparent that the process of assembling these data itself involves original compilations and rearrangements of statistical material, since the figures relating to Negroes can not generally be mechanically cut out of tables which present statistics for the Negro population as a component element in the total population. A mechanical excision of the data for Negroes from these tables would yield an aggregation of statistical fragments more or less unrelated, unintelligible, and insignificant.

The assembling and presentation of statistics for Negroes clearly involves a selection of such numbers, proportions, and ratios for other classes as are required for interpretation of figures specifically for Negroes and the rejection of all other data. It is, however, seldom the case that any important series of figures for another class is entirely without significance when it is related to a similar series for Negroes. Generally such totals, and especially all derived figures, are of greater or less significance, and selections must be made accordingly, in each case by the exercise of judgment as to what numbers, proportions, and ratios are of sufficient import specifically for Negroes to justify quotation. Finally, new analyses are frequently required to insure a fair degree of comparability of data for different years.

Consistently with the purpose of the report to present the economic and social progress of the Negro

population, in so far as that progress can be statistically determined, practically all of the tabulations included institute comparisons, either of present conditions with those obtaining in the past among Negroes, or of Negro characteristics and tendencies with those of other racial classes—comparisons, it may be noted, which have frequently involved new combinations of data for classes other than Negro and the computation of new percentages and ratios.

EMANCIPATION AND SOCIAL PROGRESS.

The compilations of the report for the most part relate to the period since emancipation, but in some detail the statistical record embraces also the period of slavery. Where it does so bridge the gap between slavery and freedom, not the least interesting fact established by the record is the unbroken persistence and gradual modification of racial characteristics and tendencies in the face of extreme social changes. No very extraordinary irregularities in the series of figures extending back into the first half of the nineteenth century mark the years of transition from slavery to freedom. Social betterment has been, not an immediate and direct consequence of a boon conferred upon the race in a given year, but rather a somewhat deferred and indirect consequence which appears in the record as an achievement of the race from decade to decade. Aggregate improvement has been substantial and progress from decade to decade has been at an accelerating rate.

Slavery, emancipation, and a half-century experience of freedom are the large facts in the history of the Negro population, and although the statistical evidence of racial progress are relatively few in the earlier decades of the period following emancipation—chiefly, it may be, because of incompleteness of the record for those years—and although these evidences are largely cumulated in recent decades, it is nevertheless important in interpreting the whole record that the date of the great event, which is still a living memory in the minds of both Negroes and whites, be kept in mind. For, however much deferred, the whole amount of racial progress must be measured by reference to the original status under slavery, and by taking account of the extreme brevity of the period comprehending this progress, when the period is measured in terms of racial rather than of individual improvement.

CHAPTER I.—THE STATES AND OUTLYING POSSESSIONS.

NEGRO POPULATION AND INCREASE: 1900–1910.

The great mass of the Negro population under the jurisdiction of the United States is resident in the states. In 1910 Negroes resident in the outlying possessions constituted only 3.8 per cent of the aggregate Negro population within the area of census enumeration, and practically this entire Negro population of the outlying possessions was in Porto Rico.

The area of census enumeration does not as a whole constitute a unit of area which may advantageously be used to any considerable extent as a basis of statistical tabulation. In this report the more detailed compilations are restricted to the population of the states, and in some cases to the population of the Southern states, in which Negroes constitute a relatively large element in the population. Some general data may, however, be introduced at the outset, relative to the number, increase, and proportion of the Negro population of these outlying areas, in comparison with corresponding data for the states, and with corresponding data for other principal classes of population.

For the areas enumerated at the Thirteenth Census, the Negro population in 1910 and in 1900, and the increase during the decade 1900–1910 was as given in Table 1.

AREA.	NEGRO POPULATION.				PERCENTAGE DISTRIBUTION, BY AREA.	
	1910	1900 ¹	Increase, ¹ 1900–1910.		Negro population, 1910.	Negro increase, 1900–1910.

¹ A minus sign (–) denotes decrease. ² In the case of Porto Rico, 1899.
³ Less than one-tenth of 1 per cent.

Of the total Negro population enumerated in 1910, numbering 10,215,482, for the areas specified in Table 1, 9,827,763, or 96.2 per cent, were returned from the states, and 385,437, or 3.8 per cent, from Porto Rico, the numbers returned from Hawaii and Alaska, being relatively insignificant.¹

During the decade 1900–1910, the Negro population of the United States, including that of the outlying territories, increased by more than a million, and of this increase, as of the population in 1910, only a small proportion was in the outlying possessions—98.3 per cent of the increase, as compared with 96.2 per cent of the population in 1910, being in the states. The rate of increase in the states, 11.2 per cent, considerably exceeded the corresponding rate of 6 per cent in Porto Rico, while the higher rates shown in the table for Hawaii and Alaska represent very small absolute population changes.

NEGRO AND OTHER RACIAL CLASSES: 1910.

Table 2 (p. 22) gives the number of Negroes and of other principal racial classes composing the populations enumerated in 1910, together with the number in each class per 1,000 population, and the percentage distribution of each class, by areas.

In Porto Rico the number of Negroes per 1,000 population was 345; in the states, 107; in Hawaii, 4; and in Alaska, 3. The population other than Negro in the states was 99.5 per cent white, although the colored other than Negro—including Indians, Chinese, and Japanese—numbered, in 1910, 412,546. In Porto Rico, also, the population other than Negro is practically all of it white.

While, as has been noted, the great mass of the Negro population was resident in the states, the proportion living in the outlying possessions, in 1910, somewhat exceeded the corresponding proportion for whites, being 3.8 per cent for Negroes, as compared with 1 per cent for whites; 1 in 26 of the Negro population, therefore, and less than 1 in 100 of the white population were living in the outlying possessions, enumerated in 1910. In the case of Negroes, however, the proportion does not to any considerable extent represent emigration from the states. The Negro populations of Hawaii and Alaska are insignificant,

¹ The Thirteenth Census did not cover the Philippine Islands, the Panama Canal Zone, Guam, or Samoa. In 1903, according to a census of the Philippine Islands, taken under direction of the Philippine Commission, the civilized blacks in a total population of 7,635,426, numbered 1,019 (males 767, females 252); the total number of blacks, including Negritos, was 24,530. A census of the Canal Zone, taken in 1912 by the Department of Civil Administration, reported the number of blacks, in a total population of 61,279, to be 30,945 (males 22,427, females 8,521). No enumerations have been made in Guam or in Samoa, except of persons included in the military and naval service of the United States.

NEGRO POPULATION.

and only an inconsiderable number of Porto Rico's black and mulatto population were born in the states.¹

INCREASE, BY CLASSES: 1900-1910.

The population increase during the decade 1900-1910 is given in Table 3 for the classes shown in Table 2. In the case of each class the increase includes increase by net immigration from foreign countries, as well as by excess of births over deaths; but foreign immigration has contributed little to the Negro increase, which, both in the states and in Porto Rico, is almost entirely a natural growth by excess of births over deaths. On the other hand, immigration has contributed largely to the growth of the white population in the states, and accounts in part for the excess of the percentage increase of the white population in the entire area of enumeration over that of the Negro population. For the aggregate area enumerated in 1910, the increase of the Negro population during the decade 1900-1910 amounted to 1,010,951, or 11 per cent., and the increase of the white population to 15,056,025, or 22.3 per cent.

¹ The number can not be precisely determined from census returns, but in the population of Porto Rico, white and colored—numbering, in 1910, 1,118,012—there were only 2,303 natives of the states. In the 1910 census report these immigrants from the states are not classified by color. In 1899, however, only 97 of the 1,069 natives of the states resident at that time in Porto Rico were colored. Exclusive of foreign-born persons the population of Porto Rico, white and colored, in 1910, was 99.8 per cent native of Porto Rico.

PROPORTION NEGRO: 1910 AND 1900.

The proportion Negro declined during the decade in Porto Rico from 382 to 345 per 1,000 population, and in the states from 116 to 107 per 1,000 population. The number of Negroes per 1,000 population other than Negro, in 1910, was 526 in Porto Rico and 120 in the states, the corresponding numbers for 1900 being 617 and 132. These proportions are shown in Table 4.

BLACK AND MULATTO POPULATION: 1910.

The Negro population of the states and outlying possessions are classified as black and mulatto, in Table 5, Negroes showing a perceptible trace of white blood being classified as mulatto.

Of the black population 99.3 per cent, and of the mulatto, 85.9 per cent were resident in the states, the proportions resident in the three outlying possessions enumerated in 1910, being 0.6 per cent for the black population, and 14.1 per cent for the mulatto. The relatively larger proportion in the outlying possessions for mulattoes is accounted for by the mulatto population native of, and resident in Porto Rico. The colored population of Porto Rico in 1910 was more than six-sevenths mulatto, the proportion mulatto being much greater in the colored population of

Porto Rico than it was in that of the states. Per 1,000 blacks in the population, there were in Porto Rico 6,671 mulattoes, and in the states, 264.

¹ Less than one-tenth of 1 per cent. ² Num ber of blacks less than 1,000.

NATIVITY AND PARENTAGE: 1910.

In the census classification, persons born in the United States or in any of its outlying territories are classified as native, all other persons being classified

as foreign born. Natives are further classified as natives of native parentage (i. e., both parents native); natives of mixed parentage (i. e., one parent native and one foreign born); and natives of foreign parentage (i. e., both parents foreign born). So classified, as shown in Table 6, the Negro population enumerated in 1910 was 99.6 per cent native, the corresponding percentage for the white population being 83.8. The Negro population was 99.1 per cent, and the white population 60.8 per cent, native of native parentage. The percentages given in Table 6 may be read as follows: Per 1,000 persons enumerated in 1910, 991 Negroes, and 608 whites were natives, born of native parents; 3 Negroes, and 73 whites were natives, having one parent foreign born; 2 Negroes, and 157 whites were natives of foreign parentage, and 4 Negroes and 162 whites were foreign born. It will be understood that as regards any single area shown in Table 6, Porto Rico, for example, the class of natives includes not only residents born in Porto Rico, but, also, those born in the states, or in some outlying possession other than Porto Rico.

CHAPTER II.—GROWTH IN THE STATES: 1790-1910.—NUMBER, INCREASE, AND PROPORTION OF NEGROES IN THE TOTAL POPULATION.

POPULATION AND INCREASE, BY CLASSES: 1900-1910.

The increase of the Negro population during the decade 1900-1910 was very nearly equal to the total Negro population of the country, as returned in the year 1800 at the second census enumeration. It fell little short of an annual average increase of 100,000. This decennial increase, and the population as returned at each of the last two censuses is shown in Table 1, with corresponding data for other principal classes.

RACIAL CLASS.	POPULATION.				PERCENTAGE DISTRIBUTION.		
	1910	1900	Increase, ¹ 1900-1910.		Population.		In- crease, ¹ 1900- 1910.

Other classes.....	3,175		3,175	(?)	(?)

¹ A minus sign (-) denotes decrease.

² Less than one-tenth of 1 per cent.

While the Negro increase of 993,769, or 11.2 per cent, for the decade may be regarded as a natural increase by excess of births over deaths, the white increase of 14,922,761, or 22.3 per cent, covered a considerable gain—estimated to be approximately 5,000,000, or one-third of the total white increase—by net immigration of whites from foreign countries. This net gain by immigration accounts in part, but it would appear, not entirely, for the difference between the rate of growth shown for the Negro, and that for the white population. For the aggregate white population the natural increase in the period from 1900 to 1910 by excess of births over deaths is estimated to have amounted to between 14 and 15 per cent. (See Thirteenth Census Reports, Vol. I, p. 127.) As indicating natural increase this estimated rate, rather than the enumerated increase of 22.3 per cent shown in Table 1 for the white population, is comparable with the Negro increase of 11.2 per cent. The aggregate white population, however, includes the foreign white stock, whose rate of natural increase undoubtedly exceeded, as that of the native white stock of native parentage undoubtedly fell short of the estimated natural

increase per cent for the aggregate white population. From the census data, rates of natural increase can not be precisely determined for the native white stock separately, or specifically for any of the several nativity and parentage classes of the whites. No census classification is sufficiently detailed, for example, to eliminate the effects of intermarriage between the classes, or to separate out the children of recent immigrants from the children of older immigrants, or the children of natives of native parentage from the children of natives of foreign parentage. But it seems probable that the rate of natural increase of the native white population, and more particularly that of the native white population of native parentage, during the decade 1900-1910, did not vary materially, if at all, exceed the rate of increase of the Negro population.

The increase shown for the Negro population in the decade 1900-1910 is equivalent to a constant annual increase of 1.07 per cent, at which rate, if it should be maintained, the Negro population would double its numbers in a period of approximately 65 years. There is, however, no statistical basis for the assumption, in the case either of the Negro or of the white population—whose corresponding doubling period would be between 30 and 40 years—that the rate of increase during the decade 1900-1910 will be maintained for any definite period. Rather it would seem probable since, as regards both Negroes and whites, the rate of growth has retarded in recent decades, that this retardation will continue more or less uninterruptedly in the future.

As enumerated at the Thirteenth Census, the Negro population—including with persons of unmixed Negro parentage persons of mixed Negro and white parentage—constituted in 1910, somewhat over one-tenth of the total population of the states. The proportion Negro in this total population fell off from 11.6 per cent in 1900 to 10.7 per cent in 1910 in consequence of the higher rate of natural increase of the white population and of the large gain by net immigration of whites.

Of the total population increase for the decade, 6.2 per cent was Negro and 93.4 per cent was white, less than one-half of 1 per cent being Indian, Chinese, Japanese, or of other racial character.

NEGRO, WHITE, AND OTHER POPULATION AT EACH CENSUS: 1790-1910.

In Table 2 is given a summary of the returns for Negroes, whites, and persons of other racial character, at each of the 13 decennial censuses.

The Negro population increased from three-quarters of one million to nearly ten million in the period of 120 years from 1790 to 1910. Of this increase, approximately one-half was in the four decades 1870-1910. The white population increased from 3,172,006 in 1790, to 81,731,957 in 1910, and for this larger popu-

lation group, nearly one-half of the increase for the period of 120 years was in the three decades 1880-1910. In other words the increase of the Negro population in the 40 years 1870-1910 was approximately equal to the increase of this class in the 80 years preceding; while in the case of the white population, the increase in the 30 years 1880-1910 was equal nearly to the increase of the preceding 90 years.

The proportion Negro in the total population decreased from 19.3 per cent, nearly one-fifth, in 1790, to 10.7 per cent, a little more than one-tenth, in 1910.

¹ For a revision of figures in accordance with estimates of population for 1870 and 1890, and with reference to extensions of the area of census enumeration, see Table 3.

Diagrams I, II, and III (p. 26) illustrate the data of Table 2, as regards growth of the Negro population from census to census absolutely and relatively to the white population.

FLUCTUATION IN THE RATES OF INCREASE.

As regards the Negro population, the returns of the several censuses taken since 1860 have been admittedly less accurate than they have been as regards the white population, and, in consequence of these inaccuracies, erroneous conclusions in respect to the rate of growth of the Negro population have been derived from the data; as, for example, that this class of the population was increasing much more rapidly than any other class, and, again, upon publication of new data, that its rate of growth was rapidly declining to a stationary state of population, and even to a state of numerical decline. None of these extravagant conclusions have been in fact justified, but it was not possible prior to publication of the Thirteenth Census data, to determine with any high degree of certainty the actual trend of the rate of growth of the Negro population in the past five decades.

It will be noted that the decennial increases of the Negro population, as shown in Table 2, and in the accompanying diagrams, for the four decades 1860-1900, are exceedingly irregular, and it should be ex-

plained that these irregularities result undoubtedly from defective enumerations at two censuses—that of 1870, and that of 1890. Some correction of the population figures for these two years, and of the dependent increases and proportions, is undertaken in Table 3.

The fluctuations in the decennial rates of increase since 1860, where these rates have been figured, as in Table 2, upon the enumerated populations returned at the several censuses, have been so considerable as to be in themselves improbable. The changes have, moreover, been in successive decades contrary in direction. Since, however, the increase of the Negro population is essentially a natural increase, any advance or decline in the rate of growth should tend in the absence of extraordinary influences to be fairly persistent, reflecting relatively permanent tendencies in the rates of natality and of mortality. Both of these rates tend, in fact, if they are changing, to move upward or downward over any long period by fairly even gradations, and such violent and contrary fluctuations in the rate of growth as are indicated for the Negro population by the decennial percentage increases, 22.1, 9.9, 34.9, 13.8, 18.0, and 11.2, in successive decades during the period extending from 1850 to 1910, imply abrupt and inconsistent changes in the birth rate or in the death rate, or in both rates conjointly, which are highly improbable.

NEGRO POPULATION.

DIAGRAM I.—NEGRO AND WHITE POPULATION AT EACH CENSUS: 1790-1910.

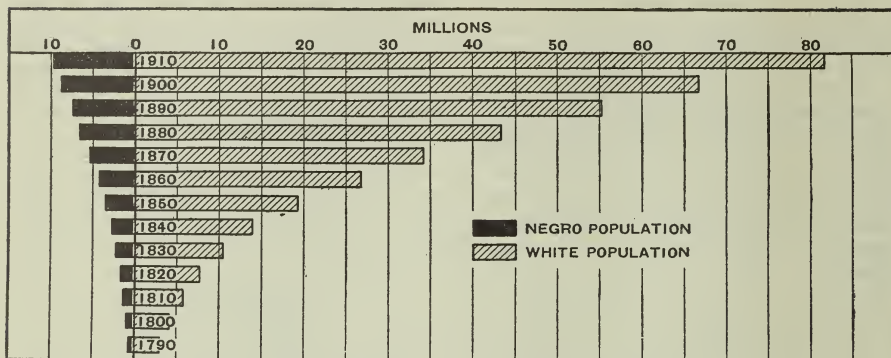

DIAGRAM II.—DECENNIAL INCREASE OF THE NEGRO POPULATION: 1790-1910.

DIAGRAM III.—DECENNIAL PERCENTAGE INCREASE OF THE NEGRO AND OF THE WHITE POPULATION: 1790-1910.

It should be borne in mind that an undercount at any census necessarily affects the rates of increase for two decades, depressing the rate for the decade preceding the defective census below, and raising the rate for the decade following above, the true rate. In the case of the Negro population, the depression of its rate of increase to 9.9 per cent for the decade 1860-1870, followed in the succeeding decade by the advance to 34.9 per cent, undoubtedly resulted from an undercount at the census of 1870; and, similarly, in the absence of any extraordinary social conditions affecting the Negro population during the decade 1880-1890, the depression of the rate of increase for this decade to 13.8 per cent, followed by the advance in the succeeding decade to 18 per cent, indicates as at least highly probable an undercount at the census of 1890. The returns at these two censuses affect the rates of increase for the four decades 1860-1900, a period, it may be noted, which is of special interest in the history of the Negro race, since it is the period in which the race was adjusting itself to a new social status. Some estimate of the number of omissions in 1870 and in 1890 is, therefore, required to develop clearly the trend of the past half century of social adjustment and emergence.

THE UNDERCOUNT OF 1870.

In the South the confusion consequent upon the war was sufficient in 1870 to interfere seriously with the Federal census enumeration of that year, and it is estimated that the returns of the Ninth Census understated the population of this section of the country by at least 1,250,000. According to this estimate—which is figured upon a somewhat arbitrary distribution of the population increase in the South during the 20-year period 1860-1880—the Negro population in the country as a whole increased 21.4 per cent in the decade 1860-1870 and 22 per cent in the decade 1870-1880.¹ In the case of the Negro

¹ The census estimate that 512,163 Negroes were omitted from enumeration in 1870 is based upon the assumption that in the Southern states the rate of increase of the Negro population in the decade 1860-1870 was the same as in the decade 1870-1880, i. e., that the Negro population of the Southern states in 1870 was the geometric mean of the Negro populations of these states as returned in 1860 and in 1880, respectively. Outside of these states the returns of the census are accepted as correct. These assumptions give a rate of increase for the aggregate Negro population during the decade 1860-1870 which is slightly below that during the decade 1870-1880 (21.4 as compared with 22 per cent). This slight depression of the rate in 1860-1870 does not seem in itself improbable, although any considerable depression in the rate for the decade 1860-1870 below that for 1870-1880 would be inconsistent with the general tendency which has been in evidence during recent decades of the rate of growth to retard—even the depression from 21.4 to 21 per cent would give a rate for the decade 1870-1880 higher than the enumerated rate for the decade 1850-1860.

population the number of omissions at the census of 1870, as estimated, exceeded 500,000 and in the case of the white population amounted nearly to 750,000.¹ The number of omissions thus constituted over 12 per cent of the Negro and over 10 per cent of the white population of the South. Since, however, the proportion living in the South was much greater in the case of the Negro than it was in the case of the white population of the country as a whole, the omissions in the Southern states constituted a much larger proportion of the total Negro than of the total white population. Relatively to the total estimated population of each class in the country as a whole, the omissions in the case of Negroes amounted nearly to 10 per cent, as compared with a proportion of somewhat over 2 per cent in the case of the whites. As regards the Negro element, therefore, the deficiencies of the census of 1870 were so considerable and with respect to different localities so indeterminate as practically to destroy the significance of the data, although the total number of omissions of Negroes at this census can be estimated for the South as a whole with a fair degree of accuracy. No attempt is made in the present report to apportion these omissions to the several states, and it would certainly be impossible to correct the data for smaller areas generally.

THE UNDERCOUNT OF 1890.

In the 20 years 1860-1880 the Negro population increased 48.2 per cent, and in the following period of 20 years, 1880-1900, 34.2 per cent. These rates are equivalent to decennial increases of 21.7 per cent for the earlier period and of 15.9 per cent for the later period. For the decade 1900-1910 the enumerated increase was 11.2 per cent. A declining rate of increase for the Negro population is clearly indicated in the data. According to the returns at the census of 1890, however, as has been noted, the Negro population increased only 13.8 per cent in the decade 1880-1890, while the percentage increase for the decade following advanced to 18. The absolute increase of 907,883, shown in the returns for the decade 1880-1890, was 280,738 less than the estimated increase in the decade immediately preceding, and 437,435 less than the enumerated increase in the decade immediately following. It seems impossible to account for the drop in the absolute and in the percentage increase for the decade 1880-1890 on any assumption other than that of an undercount at the census of 1890.

¹ See census of 1890, Population, Part 1, pp. XI, XII, and XVI. In this report the following statement is made: "These omissions were not the fault of the Census Office, nor within its control. The census of 1870 was taken under a law which the superintendent, Francis A. Walker, characterized as 'clumsy, antiquated, and barbarous.' The Census Office had no power over its enumerators save a barren protest, and even this right was questioned in some quarters."

Some indirect evidence of an undercount at this census is found in the age returns. If the Negro population were in fact increasing much more rapidly in the decade 1890-1900 than it was in the decade immediately preceding, the proportion of children in this class of the population must under normal conditions, and in the absence of highly improbable changes in the incidence of mortality by age, have increased during the decade 1890-1900. According to the census, however, the proportion of children under 10 years of age decreased from 288 per 1,000 population in 1890 to 275 per 1,000 in 1900. This decline in the proportion of children is inconsistent with a marked advance in the rate of increase. In the decade 1900-1910 the proportion of children declined further to 256 per 1,000, coincidentally with a retardation in the rate of growth. The decline in the proportion of children at each census, 1880-1910, would indicate as probable a more or less continuous retardation in the rate of natural growth.

Evidence of an undercount in 1890 may be found also in what may be called the decennial mortality rate for the several decades, as indicated by census returns of age. The Negro population 10 years of age and over, as enumerated at the census of 1890, was 5,293,159. This was approximately the number of survivors in 1890 of the total Negro population enumerated in 1880, and indicates a gross mortality for the decade of 1,287,634, or 19.6 per cent. The corresponding mortality rate for the decade 1890-1900 was 15 per cent; and for the decade 1900-1910, 17.5 per cent. This crude census mortality rate for the decade 1880-1890 is, therefore, nearly one-third higher than that for the decade 1890-1900, while the rate for the decade 1900-1910 is approximately midway between the rates for the two preceding decades, as it would normally be if the rates for the two preceding decades had been materially affected by an undercount in 1890. It is, moreover, entirely improbable that the mortality rate for the Negro population was markedly higher in the decade 1900-1910, than it was in the decade preceding. It is probable rather that the rate has either remained fairly constant or decreased in each decade 1880-1910. The only plausible explanation of the variation in the rate from decade to decade, is an undercount in 1890, which indicated an improbably high mortality rate for the decade 1880-1890, and an improbably low mortality rate for the decade 1890-1900.

The presumption of an undercount at the census of 1890, therefore, rests upon the improbability of the decennial rates of increase themselves, as developed from the census returns, the inconsistency of the indicated changes in the rates from decade to decade with the changes in the proportion of children in the Negro population, and upon the improbability of the decennial mortality indicated for the decades 1880-1890 and 1890-1900.

The number of omissions at the census of 1890 can not be accurately determined, but it would seem to be a fair assumption—in consideration especially of the decrease in the proportion of children from census to census—that the decline in the rate of increase from decade to decade was constant, and that the rate fell off in each of the two decades 1880-1890 and 1890-1900 by approximately the same amount. If the Negro increase of 34.2 per cent in the 20-year period 1880-1900 be so distributed as to give equal decreases in each decade from the estimated rate of 22 per cent in the decade 1870-1880, the increase for the decade 1880-1890 was 17.9 per cent, and for the decade 1890-1900, 13.8 per cent, those rates being equivalent to the enumerated increase of 34.2 per cent for the 20 years 1880-1900. On this assumption, the probable rates of increase for the four decades 1870-1910 are 22, 17.9, 13.8, and 11.2 per cent. Although the rate of 11.2 per cent, for the decade 1900-1910, is the enumerated increase per cent for that decade, and is, therefore, in no way affected by the distribution of the increase in the preceding 20-year period, it will be noted, that it is, nevertheless, entirely consistent with the assumption of a constantly decreasing rate for the four decades. A rate of 17.9 per cent for the decade 1880-1890 would give a Negro population in 1890 of nearly 7,760,000, which in round numbers exceeds the population as enumerated at the census of 1890 by 270,000. This is approximately the number of omissions of Negroes at the census of 1890, on the assumption that the retardation in the rate of growth in the 20 years 1880-1900 was constant.

It is not improbable that at other recent censuses the proportion of omissions has been higher, and the proportion of duplications lower in the enumeration of the Negroes than it has been in the enumeration of the whites; and that in general the margin of error has been greater in the case of Negroes. The percentage increase of the Negro population would not, however, be affected by this undercounting in so far as the population was understated at the several censuses by any constant percentage. If, for example, the census of 1900 and that of 1910 each of them understated the Negro population by 1 per cent, or by any greater proportion, the percentage increase figured upon the census returns would, nevertheless, be the true percentage increase for the decade, and it would be entirely comparable with the percentage increase for other classes, whatever the proportion of omissions or duplications for those other classes, provided only that the proportions should be as regards each class unvarying from census to census. Where, however, the proportion of omissions at any census is exceptionally large, as at the census of 1890, the decennial percentage increase for two decades will be materially affected.

INCREASE AFFECTED BY EXTENSION OF AREA.

In considering the increase of population from decade to decade, it should be noted that the area of census enumeration in the states has been considerably extended at several censuses. At the census of 1890, for example, the population of Indian Territory and on Indian reservations was enumerated for the first time, and in Table 2 this population—aggregating 325,464 persons, among whom were 18,636 Negroes, and 117,368 whites—is included in the increase for the decade 1880-1890. It will be obvious, however, that only a portion of the population enumerated in these areas is properly classified as increase for the decade, and that that portion representing the growth of population during the decade, if it could be determined, could not all of it be properly regarded as constituting a portion of the increase of the population enumerated at the census of 1880. By excluding the population of the added areas from the total population enumerated in 1890, the population increase within the area enumerated at the census of 1880 may be determined. The exclusion of areas representing extension of the area of enumeration at the census of 1890 reduces slightly the decennial increase per cent both for Negroes and for whites. In the case of Negroes the reduction is from 13.8 to 13.5 per cent and in the case of whites, from 27 to 26.7.

At other censuses, also, as well as at the census of 1890, the area of census enumeration has been extended to embrace new territory, and these accidental extensions have tended in each case to raise the percentage increase somewhat above that which would represent the growth of population during the decade. At the census of 1850, for example, the areas enumerated first in that year aggregated 335,300 square miles, representing an increase for the decade 1840-1850 of more than one-fourth in the area of census enumeration. This added area returned a population in 1850 of 391,410 persons, among whom were 59,799 Negroes and 331,611 whites. The exclusion of this population from the increase for the decade 1840-1850 reduces the percentage increase for the Negroes from 26.6 to 24.5, and for the whites from 37.7 to 35.4. Undoubtedly the population of the areas enumerated first in 1850 embraces a considerable number of migrants who had entered these areas during the decade, coming in from other sections of the country, and the increase in the area enumerated in 1840 is reduced by the number of such migrants.

REVISED FIGURES OF INCREASE 1790-1910.

In Table 3 the increase of the Negro population is shown for each decade, exclusive of the population of areas which represent extensions of the area of census enumeration in the given decade, and the

increases and proportions given in the table, is so far as they pertain to the years 1870 and 1890, are figured upon the estimated populations for these years.

YEAR.	Increase during preceding 10 years.				White population increase per cent Negro in the total population.	Negroes per 1,000 white population.		
	Number.	Total.	Popu-lation of area enumerated first in year specified.	Increase within area enumerated at preceding census.

1790.....	737,298	19.3	239

¹ Figures in italics are estimates.
² Includes slaves only for western Georgia.

Fluctuations in the percentage increase are markedly reduced in Table 3, as compared with those shown in Table 2, even for the earlier decades. According to Table 2, for example, the Negro population in the two decades 1790-1800 and 1800-1810 increased 32.3 and 37.5 per cent, respectively, the corresponding increases according to Table 3 being 31.7 and 32.9 per cent. In the case of the white population, fluctuations in the rates for the five decades 1790-1840 almost entirely disappear in Table 3, the rates being 34, 34.9, 34.2, 33.7, and 34.3 per cent, respectively. In both tables the maximum rate of increase for the Negro population is that for the decade 1800-1810 and the next highest that for the decade 1790-1800; but the maximum rate is reduced from 37.5 to 32.9 per cent by excluding from the increase the population of areas enumerated first in 1810.

The increase of the Negro population in the two decades 1790-1810, the period of its most rapid rate of growth, is in part attributable to the continued importation of slaves during the years 1790-1808, but for the period of 100 years, from 1810 to 1910, net immigration or emigration of Negroes has been inconsiderable. In the case of the white population, on the other hand, immigration has contributed largely to its increase not only in the last decade, but in each preceding decade.

During the four decades 1790-1830 there was no considerable change from decade to decade in the percentage increase of the Negro population. As shown in Table 3, the increases for these decades were 31.7, 32.9, 28.6, and 30.5 per cent, respectively. For the

five decades 1830-1880, also, the decennial percentage increases—i. e., 23.4, 24.5, 22, 21.4, 22—remained fairly constant without any marked fluctuations or persistent tendency upward or downward, although the percentages indicate clearly a retardation of the rate growth in this period as compared with the rate maintained in the earlier period. The minimum rate for the period 1790-1830, 28.6 per cent, is considerably above the maximum rate, 24.5 per cent, for the later period, while the average of the decennial rates dropped from 30.9 per cent for the four decades 1790-1830 to 22.7 per cent for the five decades 1830-1880.

If the increases shown in Table 3 be accepted as accurate, it appears that the growth of the Negro population, considered by decades, was greatest in the decade 1870-1880, the estimated addition to the population in this decade being 1,188,621. In the period from 1790 to 1880 the absolute growth of the Negro population increased from decade to decade, with exception that the growth in the decade ending in 1840 was practically the same as in the decade preceding. In each decade since 1880, however, the absolute increase, as well as the percentage increase, has tended to fall off.

The proportion Negro in the population has decreased in each decade, with exception of a slight increase for the decade 1800-1810. During the first four decades, however, although the total population more than trebled, the decrease in the proportion Negro, from 19.3 per cent in 1790 to 18.1 per cent in 1830, was inconsiderable, amounting to an average decrease in the percentage per decade of only 0.3; in other words, the number of Negroes per 1,000 population decreased on the average by 3 in the course of each 10 years. In the period 1830 to 1910 the decennial decreases in the percentage Negro were generally greater than those for the earlier period, the decrease from 18.1 per cent in 1830 to 10.7 in 1910 being equivalent to an average decrease per decade for these eight decades of 0.9, or 9 per 1,000 population. This is the amount of the decrease in the last decade—from 11.6 per cent in 1900 to 10.7 per cent in 1910.

The proportion of Negroes to whites was somewhat less than 1 to 4 in 1790, and 1 to 8 in 1910, the number of Negroes per 1,000 whites being as shown in Table 3, in the two years, respectively 239 and 120.

INCREASE BY 30, 50, AND 60 YEAR PERIODS: 1790-1910.

In Table 4, on the following page, the increase of the population, Negro and white, is shown by 30, 50, and 60 year periods.

In each of the two 30-year periods, 1790-1820 and 1820-1850, the Negro population more than doubled its numbers, the increase amounting to 134 per cent in the earlier period and to 105.4 per cent in the later. For the two succeeding 30-year periods the percentage

NEGRO POPULATION.

increase fell off to 80.9 for the period 1850-1880 and to 49.3 for the period 1880-1910. The percentage increase from 1790 to 1820 was thus nearly three times as great as the percentage increase from 1880 to 1910. The corresponding percentages for the white population in the several periods are 148, 148.6, 122, and 88.3.

Although the percentage increase of the Negro population fell off from period to period, the lower percentages for the later periods represent larger absolute additions to the population. In the 30-year period 1790-1820, with a percentage increase of 134, the growth of the Negro population amounted to a little over one million, while in the period 1880-1910, with a percentage increase of 49.3, the growth of population exceeded three million. In the 50 years 1860-1910 the increase of 121.3 per cent amounted to 5,385,933 persons, while the increase of 222.4 per cent for the 50 years preceding the war, in terms of population, was less than three-fifths as great, the absolute

increase for the earlier period being 3,064,022. If the period 1790-1910 be divided into two periods of 60 years each, the percentage increase in the period 1790-1850 is more than twice the corresponding percentage for the period 1850-1910, while the absolute increase in the earlier period is less than one-half that in the later period.

CHAPTER III.—GEOGRAPHIC DISTRIBUTION AND INCREASE, BY STATES: 1790-1910.

AREAS.

State areas, and combinations of state areas into geographic divisions and sections, are the units of area with reference to which the Negro population is classified in the tables following. These tables, therefore, do not comprehend the distribution of that population in detail with reference to urban and rural communities, or by county areas. In subsequent chapters statistics are given relating to the distribution within the several states—by urban and rural communities in Chapter VII and by county areas in Chapter VIII.¹

For the Negro population statistical interest attaches largely to compilations relating to the South as a whole, in which this class constitutes a considerable population element, and to the South in comparison with the North and the West, since the natural, social, and economic environmental conditions in the several sections are more or less dissimilar. The Negro population living in the North and West has increased by migration from the South in recent decades, as well as by natural growth, and in 1910 exceeded one million—a number sufficient to provide, in comparison with the South, significant data relative to progress achieved by the race under diverse conditions of living.

RACIAL CLASSES, BY SECTIONS AND DIVISIONS: 1910.

The geographic distribution of the Negro, white, and other population classes in 1910 is shown in Table 1, by sections and divisions.

The Negro population of the South in 1910 numbered 8,749,427, and amounted to 89 per cent, or approximately nine-tenths of the total Negro population of the country. The white population of the South numbered 20,547,420, and amounted to 25 per cent, or one-fourth, of the total white population.

¹ The primary areas of census enumeration are the enumeration districts—of which there were approximately 70,000 at the census of 1910—devised at each census for administrative purposes, and representing in themselves no permanent civil divisions. The returns of population from these districts are compiled into totals for the minor civil divisions of counties and cities, and these totals into totals for the counties and cities themselves, and further into aggregates for states. The states are grouped to compose the nine geographic divisions, and for certain tabulations the divisions are combined into sections—the South, the North, and the West. In those tables which give statistics by states (see, for example, Table 13 of this chapter), with few exceptions the states are arranged geographically under the divisional headings. In the published reports of the census the population is not classified by race or other characteristic for county or minor civil divisions. Urban communities and counties are therefore the primal areas of compilation in the present report.

Thus the great mass of the Negro population was in the South, and to a somewhat less degree it is true that the great mass of the white population was in the North and West.

In the North the Negro population numbered 1,027,674, and in the West 50,662, the white populations for these two sections being, respectively, 54,640,209 and 6,544,328.

Considering the nativity and parentage classes of the white population, it appears that a much larger proportion of the native white of native parentage, than of the white population of foreign birth or parentage was resident in the South. The proportion in the South for the native white of native parentage (i. e., both parents native), was 37.5 per cent; for the native white of foreign parentage (i. e., both parents foreign born), 5.9 per cent; for the native white of mixed parentage (i. e., one parent native, one foreign born), 8.3 per cent; and for the foreign-born white, 5.4 per cent. For the Negro population the proportion living in the South—89 per cent—was much higher than the corresponding proportion for any other race or nativity class.

In 1910 the Negro population of the South Atlantic division numbered 4,112,488; that of the East South Central, 2,652,513; and that of the West South Central, 1,984,426—more than two-fifths of the total Negro population of the country being in the South Atlantic division.

Except in Oklahoma the colored population of the South is almost entirely Negro, the colored, other than Negro—including Indian, Chinese, and Japanese—constituting a very inconsiderable factor in the total colored population. Of this other colored population in the South, numbering 92,483 in 1910, 88,433 were Indian; 3,299 were Chinese; 610 Japanese; and 141 of other racial character. As may be seen by reference to Table 13 (p. 43), a large proportion of the Indian population of the South—74,825 out of 88,433—was in Oklahoma. In the South, exclusive of Oklahoma, the Negro population numbered 8,611,815 and the other colored only 17,471. The colored other than Negro constituted a more considerable element in the total colored population of the North, and was largely in the majority in the colored population of the West. The proportion Negro in the colored population was 99 per cent in the South as a whole, and

NEGRO POPULATION.

99.8 per cent in the South, exclusive of Oklahoma. It was 92 per cent in the North, and in the West only 18 per cent.

Diagram I (p. 33) distributes the population of divisions in 1910, by color, nativity, and parentage, combinations having been made of certain classes shown separately in Table 1. The population of each division is classified in the diagram as Negro, native

white of native parentage, native white of foreign or mixed parentage, foreign-born white, and all other. The areas of the bars are proportional to the populations of the divisions, and the areas shaded for the several classes are proportional to the numbers in those classes. By a comparison of areas, therefore, the relative numerical importance of the classes in the divisions and in the country as a whole becomes apparent.

GEOGRAPHIC DISTRIBUTION OF RACE, NATIVITY, AND PARENTAGE CLASSES, BY SECTIONS AND DIVISIONS: 1910.

NEGRO AND WHITE POPULATION, BY SECTIONS AND DIVISIONS: 1790-1910.

In Table 2 is given the total, the Negro, and the white population at each census, 1790-1910, by geographic sections and divisions.

At the date of the first census, in 1790, the Negro population of the South numbered 689,784. Of this population, 673,462 were resident in the South Atlantic states, and 16,322 in the East South Central region. The Negro population of the North numbered 67,424, and this population was all of it returned from the New England and Middle Atlantic states. The entire Negro population, therefore, except the 16,322 re-

turned from the East South Central region, was resident in the states of the Atlantic seaboard. The entire white population, also, was returned from these states, with exception of 93,046 enumerated in the East South Central region, although undoubtedly some white population was at this date settled in the territory north of the Ohio River, which was not embraced in the area of census enumeration. No population whatever was returned prior to 1850 from any portion of the region now included in the West (the Mountain and Pacific divisions). The greater portion of this far western region was, in fact, brought under the jurisdiction of the United States in the decade preceding the census of 1850.

¹ Less than one-tenth of 1 per cent.

As regards the Negro population, the proportion resident in the South has not varied greatly from census to census. In 1790 the proportion living in the South was 91.1 per cent, and this proportion increased slightly in succeeding decades, to a maximum proportion of 92.8 per cent in 1830. It was 91.9 in 1840; 92.1 in 1850; and 92.2 in 1860. It fell off to 90.6 in 1870; and thereafter declined slightly, from census to

DIAGRAM I.—COLOR, NATIVITY, AND PARENTAGE OF THE POPULATION BY DIVISIONS: 1910.

census, to 89 in 1910. Conversely, the proportion living in the North and West, which was 8.9 per cent in 1790, fell off to 7.2 per cent in 1830, and in succeeding decades, with some fluctuation, increased to 11 per cent in 1910.

As between the South and the North, therefore, the net changes in the geographic distribution of the Negro population have not been very considerable over an extended period, although the proportion in the North has tended in recent decades to increase.

During the entire period 1790-1910 the principal direction of migration and growth for the Negro population of the South, as for the white, has been westward. In 1790, of the total Negro population, 88.9 per cent was resident in the South Atlantic states. This population increased in each decade, from 673,462 in 1790 to 4,112,488 in 1910, but at each census, notwithstanding its rapid increase, the population of this division constituted a smaller proportion of the total Negro population in the country as a whole. In the period from 1790 to 1860 the percentage living in this division decreased from 88.9 to 46.3, and the decline in the proportion has been continuous since 1860, although the aggregate change in the period of 50 years, from 46.3 per cent in 1860 to 41.8 per cent in 1910, was less than the average change per decade for the period from 1790 to 1860.

At each census, 1790-1860, the proportion living in the East South Central division increased, the increase being from 2.2 per cent in 1790 to 31.4 per cent in 1860. At each census since 1860 the proportion in this division has decreased, to 27 per cent in 1910. The proportion living in the West South Central division has increased continuously from 3.1 per cent in 1810, to 20.2 per cent, or approximately one-fifth, in 1910.

NEGRO AND WHITE INCREASE, BY SECTIONS AND DIVISIONS: 1790-1910.

The Negro and white population increases are shown, by sections and divisions, for the decade 1900-1910, in Table 4, and by 30-year periods, 1790-1910, in Table 5.

Pacific.....	14,531	1,730,260	99.1	75.4	1.5	11.6

In the decade 1900-1910 the Negro population of the South increased by 826,458, or 10.4 per cent; the white population by 4,025,450, or 24.4 per cent. The Negro population of the North increased by 146,903, or 16.7 per cent; the white population by 8,226,451, or 17.7 per cent. In the West the Negro increase amounted to 20,408, or 67.5 per cent; and the white increase, to 2,670,860, or 69 per cent.

The percentage increase of the Negro population in the South was slightly below, and the percentages for the North and West were considerably above the rate of 11.2 per cent shown for the Negro population of the country as a whole. The relatively high percentage increases for the North and West indicate some gain by net migration of Negroes into these sections from the South during the decade; not, however, a gain so considerable in dimensions, when measured against the aggregate Negro population of the South, as to constitute anything in the nature of a general exodus from the South. Such a gain is indicated clearly for the Middle Atlantic division, in which the Negro population increased by 91,949, or 28.2 per cent, and for the smaller populations of the Mountain and Pacific divisions, in which the percentage increases were 37.7 and 99.1, respectively. In the West, where the Negro population is numerically inconsiderable, it is clear that a comparatively small gain by migration—measured in thousands of migrants—would be sufficient to produce the high rate of increase shown in the table. As between the North and the South it should be borne in mind that the net migration of any given number would affect the rate of increase more in the North than in the South, owing to the fact that the Negro population resident in the North is smaller than that resident in the South. In a subsequent chapter statistics are presented which indicate the extent to which the several sections of the country have gained or lost by interstate migration (see Chapter VI).

The Negro population of the South Atlantic division increased in the decade 1900-1910 by 383,471, nearly two-fifths of the total Negro increase being in this division; that of the East South Central division increased by 152,627; and that of the West South Central division by 290,360.

The percentage increase in the South Atlantic division was 10.3 for the Negroes and 20.4 for the whites; in the East South Central division it was 6.1 for Negroes and 14.1 for whites; and in the West South Central division 17.1 for Negroes and 40.9 for whites. Thus in each of those divisions, the percentage increase for whites considerably exceeded that for Negroes. The divisional increases of both Negroes and whites were obviously affected by migration during the decade, since the percentage increases in several of the divisions depart widely from the average for the country as a whole.

During the 30 years 1880-1910, as shown in Table 5, in the South the Negro increase amounted to 2,795,524 and the white increase to 9,991,993; in the North the Negro increase amounted to 412,636 and the white increase to 23,404,942; in the West the Negro increase amounted to 38,810 and the white increase to 4,932,052. The percentage increase in the South was 47 for the Negro population and 94.7 for the white population; in the North 67.1 for Negroes and 74.9 for whites; and in the West 327.5 for Negroes and 305.9 for whites. In the 30 years 1790-1820 the Negro population at the South increased at a more rapid rate than the white population, the percentage increases being, respectively, 138.1 and 118.4. In the following period the percentages were more nearly equal, the percentage for Negroes being somewhat higher than that for whites. In the two succeeding periods the percentage increase for Negroes fell below that for whites. Nearly one-half of the total Negro increase in the South from 1820 to 1850 was in the East South Central division, in which the increase amounted to 834,733, or 289.8 per cent. This increase was largely by migration from the South Atlantic division, in which the rate of growth was reduced far below the rate for the South as a whole.

NEGRO AND WHITE POPULATION, BY STATES: 1790-1910.

The Negro and the white population of the states and divisions at each census, 1790-1910, is given in Table 13, pages 43 to 45, which gives also, for 1910 and for 1900, the Indian and all other population. The Negro populations of the states in 1910 and in 1900 are also represented by the diagram on page 36.

At the date of the First Census, in 1790, Virginia's Negro population of 305,493 greatly exceeded that of any other state. Two-fifths of the total Negro population of the country were resident in this state, although three other states reported populations in

excess of 100,000—Maryland, 111,079; North Carolina, 105,547; and South Carolina, 108,895. The fifth largest Negro population was that of Georgia, 29,662, and the sixth largest that of New York, 25,978. Negroes were reported from every state enumerated, the number returned from New Hampshire, 788, being greater than the number returned from that state at the census of 1910.

Throughout the period from 1790 to 1860, Virginia maintained her preeminence as regards Negro population over all other states. At the census of 1860, 5 Southern states reported Negro populations in excess of 400,000—Virginia, 548,907; Georgia, 465,698; Alabama, 437,770; Mississippi, 437,404; South Carolina, 412,320—and 7 other Southern states reported Negro populations in excess of 100,000. At the census of 1870 and at each succeeding census Georgia's Negro population exceeded that of any other state. In 1910 its Negro population numbered 1,176,987. One other state, Mississippi, in 1910, reported a Negro population in excess of 1,000,000. Six states besides Georgia and Mississippi, reported Negro populations in excess of 500,000, and 11 other states, of which 5 were Northern, Negro populations in excess of 100,000.

The rank of the states, as regards Negro, white, and total population in 1910, is shown in Table 6, in which the states are arranged in order, according to their Negro population, these populations being also cumulated by states.

Of the 13 states reporting Negro population in excess of 200,000 in 1910, all were Southern. The aggregate Negro population of these states was 8,422,015, amounting to 85.7 per cent, or six-sevenths of the total Negro population of the country. The remaining one-seventh of the Negro population was reported from 35 states—of which 3 (Oklahoma, West Virginia, and Delaware), were Southern—and the District of Columbia, whose populations ranged from 513 in Nevada to 193,919 in Pennsylvania. The 13 states report-

ing six-sevenths of the Negro population reported approximately one-fifth of the white population of the country.

Georgia, which ranked first in Negro population in 1910, ranked twentieth in white population and tenth in total population. Mississippi, the second most populous state as regards Negro population, ranked thirtieth in white population and twenty-first in total population. Alabama ranked third in Negro population, twenty-second in white population, and eighteenth in total population. New York, which ranked first in total and in white population, ranked seventeenth in Negro population. Pennsylvania, which ranked second in total and in white population, ranked fourteenth in Negro population.

DIAGRAM II.—NEGRO POPULATION, BY STATES: 1910 AND 1900.

NEGRO AND WHITE INCREASE, BY STATES: 1790-1910.

The increase of the Negro and of the white population, during the decade 1900-1910, and by 30-year periods, 1790-1910, is given for states and divisions in Table 7, on the following page. These increases are figured upon the populations of Table 13.

During the decade 1900-1910 the Negro populations increased in 42 states and in the District of Columbia, and decreased in 6 states, of which 3 were Southern and 3 Northern.

In each of the nine geographic divisions the percentage increase for this class of the population varied greatly from state to state. In the case of no one of these divisions, in fact, is the rate of increase for the division as a whole even approximately indicative of the several rates for the states composing the divisions. In New England, for example, the Negro population increased 12.2 per cent, but this average for the

GEOGRAPHIC DISTRIBUTION AND INCREASE.

1 Dakota Territory.

NEGRO POPULATION.

division covers state rates ranging from a decrease of 14.8 per cent in New Hampshire, to an increase of 96.2 per cent in Vermont; the state rate most nearly approaching the average is that of 19 per cent for Massachusetts. The increase for the South Atlantic division was 10.3 per cent, but in this division the state increases range from a decrease of 1.2 per cent in Maryland, to an increase of 47.5 per cent in West Virginia. In the East South Central division a divisional increase of 6.1 per cent covers state rates ranging from a decrease of 8.1 per cent in Kentucky to an increase of 11.2 per cent in Mississippi. In the West South Central division a rate of 17.1 per cent covers state rates ranging from 9.7 in Louisiana to 147.1 per cent in Oklahoma. In the West North Central a divisional rate of 2 per cent increase covers state rates ranging from a decrease of 2.3 per cent in Missouri to an increase of 115.7 per cent in North Dakota. In the four other divisions the divergences of the state rates from the divisional rates are equally marked.

¹ A minus sign (-) denotes decrease.

The wide range of variation in the state rates of increase is apparent in Table 8, in which the states are ranged in order according to the percentage increase of the Negro population, the percentage increase for the white population being given for comparison.

More than one-half of the total Negro population in 1910 and more than one-half of the increase during the decade 1900-1910 was in the 6 Southern states, in which the percentage increase during the decade ranged from 9.7 to 13.7. These states and their percentage increases were: Georgia, 13.7; North Carolina, 11.7; Mississippi, 11.2; Texas, 11.2; Alabama, 9.8; and Louisiana, 9.7. The aggregate Negro population of these 6 states in 1910 was 5,196,522, and the aggregate increase in the preceding decade amounted to 530,777, or 11.4 per cent. Although the 26 states, with higher rates of increase, reported less than one-fifth of the total Negro population in 1910, the increase in these states exceeded two-fifths of the total Negro increase for the decade. In 1910 these 26 states reported a Negro population of 1,712,497, and an aggregate increase of 421,018, or 32.6 per cent. Only 3 of this group of states were Southern—Oklahoma, increase 81,928, or 147.1 per cent; West Virginia, increase 20,674, or 47.5 per cent; and Florida, increase 77,939, or 33.8 per cent. In 16 states and in the District of Columbia, the Negro population increased at rates below 9.7 per cent, or decreased. Four of the 6 states in which the Negro population fell off during the decade, namely, Maryland, Tennessee, Kentucky, and Missouri were states with a considerable Negro population. In Virginia the increase amounted to only 1.6 per cent; and in South Carolina, to 6.8 per cent.

While approximately one-half of the Negro population in 1910 was living in states in which the percentage increase was near the average for the Negro population as a whole, the increases in the states generally are characterized by wide divergencies from the average—ranging from a decrease of 14.8 per cent to an increase of 282.8 per cent.

The Negro increase of two states in the decade 1900-1910 exceeded 100,000. In Georgia the increase amounted to 142,174 and in Mississippi to 101,857. Georgia's Negro increase in this decade and in each of the three 30-year periods 1820 to 1910 exceeded that of any other state. In the 30 years 1790-1820, the Negro population of Georgia increased by 121,757; in the 30 years 1820-1850, by 233,194; in the 30 years 1850-1880, by 340,520; and in the 30 years ending in 1910, by 451,854. In this latter period the Negro population of Mississippi increased by 359,196; that of Alabama, by 308,179; that of Texas, by 296,665; that of Arkansas, by 232,225; that of South Carolina, by 231,511; that of Louisiana, by 230,219; and that of 3 other states—Florida, North Carolina, and Oklahoma—by more than 100,000.

The white increase exceeded the Negro increase in each state during the decade 1900-1910 and in the 30-year period 1880-1910. In the preceding 30-year period 1850-1880, the Negro increase exceeded the white in South Carolina, Georgia, Alabama, Mississippi, and Louisiana.

NEGRO AND FOREIGN-BORN WHITE POPULATION:
1900-1910.

Some interest attaches to the increase in recent decades of the foreign-born white population in the South, since this class competes more directly than other classes with the Negro population in certain lines of employment.

The Negro and the foreign-born white population in 1910 and in 1900, and the increase 1900-1910 of these classes of the population, with the number of foreign-born whites to 1,000 Negroes, are given in

Table 9, for sections and southern divisions and states. Only a small proportion of the foreign-born white population is resident in the South. In 1910 the number of this class in the South was 726,171, or 5.4 per cent of the total foreign-born white population of the country. In this year foreign-born whites constituted only 2.5 per cent of the total population of the South. The increase during the decade 1900-1910 in the South amounted to 163,596, or 29.6 per cent, the corresponding increase for the Negro population being 826,458, or 10.4 per cent. According to these figures the absolute increase of the foreign-born whites was approximately one-fifth as great as that of the Negroes, although in the increase of adults, the proportion foreign-born white was undoubtedly greater than in the increase of the population of all ages, because the foreign-born whites are largely in the adult ages.

¹ A minus sign (-) denotes decrease.

² Less than one-tenth of 1 per cent.

In the South Atlantic division the foreign-born white population increased by 81,672, or 39.1 per cent; the Negro population by 383,471, or 10.3 per cent. In the East South Central division the foreign-born white population decreased by 2,825, or 3.2 per cent, and the Negro population increased by 152,627, or 6.1 per cent. In the West South Central division the foreign-born white increase amounted to 84,749, or 32.1 per cent, and the Negro increase to 290,360, or 17.1 per cent.

Nearly one-third of the total foreign-born white population of the South in 1910 and more than one-third of the foreign-born white increase for the decade 1900-1910 in the South was in the state of Texas. The percentage increase for this class during the decade 1900-1910 exceeded that for the Negro population in all but four Southern states. In three Southern states—Alabama, Maryland, and West Virginia—the absolute as well as the percentage increase of the foreign-born whites exceeded that of the Negro popu-

NEGRO POPULATION.

lation, and in Tennessee the foreign-born white population increased by 873, while the Negro population decreased by 7,155.

The number of foreign-born whites to 1,000 Negroes in the South in 1910 was 83; in the North, 11,016; and in the West, 25,628. In each section the proportion of foreign-born whites to Negroes increased during the decade 1900-1910. Among Southern states in 1910 the proportion was highest in West Virginia—889 foreign-born whites to 1,000 Negroes—and lowest in South Carolina—7 foreign-born whites to 1,000 Negroes.

DENSITY OF NEGRO AND WHITE POPULATION, TOTAL AND RURAL: 1910.

Tables 10 and 11 give the density of the Negro and white population and of the Negro and white rural¹ population in 1910, as indicated by the average population of each class per square mile of area—Table 10 for sections and southern divisions; and Table 11 for the states.

SECTION AND DIVISION.	Area in square miles.	POPULATION PER SQUARE MILE: 1910.					
		Total.			Rural.		
		All classes.	Negro.	White.	Negro.	White.	
The South.....	878,326	33.5	10.0	23.4	7.9	18.0	
South Atlantic.....	299,071	45.3	15.3	30.0	11.9	21.9	
East South Central.....	179,509	46.8	14.8	32.1	11.9	26.1	
West South Central.....	429,746	30.4	4.6	15.6	3.6	12.1	
The North.....	918,344	60.7	1.1	59.5	0.3	24.8	
The West.....	1,177,220	5.8		5.6		2.8	

These densities are averages for state areas and combinations of state areas, and do not necessarily indicate conditions prevailing within any subdivision of the state. Where, for example, the total population, urban and rural, is related to the total area, the density figure for a state with any considerable urban population does not necessarily represent conditions prevailing anywhere in the state, either in urban communities or in rural districts. A somewhat closer approximation may be made to conditions prevailing outside of urban communities by relating the rural population to total area, although the density of the rural population itself may vary markedly from one rural district to another within any given state. Moreover, the Negro population may be resident predominantly in one rural section and the white population in another, and in such cases the averages for the state would not represent accurately the density of either class or the relative number of Negroes and whites in any section. The averages represent the condition which would prevail generally were each class of the population distributed evenly over the territory of the state, or division, or section, and to

¹ The rural population is the total population living outside of cities and other incorporated places of 2,500 or more inhabitants.

the extent that the distribution of the population approximates such a distribution, the averages represent conditions actually prevailing.

In the South as a whole the Negro population averaged 10 per square mile; in the North, 1.1; and in the West, less than 1 in 20 square miles. The corresponding densities for the white population were 23.4, 59.5, and 5.6 persons per square mile. The rural Negro population averaged 7.9 persons per square mile in the South, and the rural white, 18. The population per square mile, Negro and white, total and rural, was much less in the West South Central division than it was in the South Atlantic or East South Central divisions.

In Table 11 the states are arranged in order, according to the density of the Negro population. The Negro population of South Carolina in 1910 averaged 27.4 per square mile. This density exceeded the corresponding density for any other state, and exceeded the density of the white population in South Carolina, which amounted to 22.3.

¹ States having Negro population less than 1 per square mile are omitted. These states are as follows: Arizona, California, Colorado, Idaho, Iowa, Kansas, Maine, Michigan, Minnesota, Montana, Nebraska, Nevada, New Hampshire, New Mexico, North Dakota, Oregon, South Dakota, Utah, Vermont, Washington, Wisconsin, Wyoming.

GEOGRAPHIC CENTER OF THE NEGRO POPULATION: 1790, 1880-1910.

The center of population is the point to which the population in the aggregate is nearest—the point at which the population could assemble by traveling in the aggregate the least number of miles, assuming that each individual could travel in a direct line from his place of residence to the point.

Theoretically, the point responds to each change in residence on the part of individuals composing the population, and to the growth or decline of population in any community. Its movement in any direction from census to census is a resultant of the local growth or decline, and the net drift of population during the intervening decade.

By analogy it may be described as the center of gravity of population. If the surface of the United States be conceived as being a rigid plane without weight, capable of sustaining the population distributed thereon—individuals being assumed to be of equal weight, and each, therefore, to exert a gravity pull with reference to any supporting pivotal point directly proportional to his distance from the point—the pivotal point on which the plane balanced, that is to say, its center of gravity—would be the center of population.

It will be obvious that the center is not necessarily located in a region of great density of population. It may, on the contrary, be located in a region of relatively low density. The density of population in the

¹ For an account of the method of determining the center of population, see Thirteenth Census report, Vol. I, p. 46.

region immediately surrounding the center is in fact a very inconsiderable factor in determining the location of the point, which by the general geographic disposition of the aggregate population of the country may be brought indifferently into a desert, a wilderness, or a relatively populous community.

The center of the Negro population in 1790 and at each of the four censuses 1880-1910 is indicated on the accompanying map by stars.

As a consequence of changes in the geographic distribution of the Negro population, due to growth and migration during the period of 90 years 1790-1880, the center moved from a point in Dinwiddie County, Va., to a point 443 miles southwest, located in Walker County, in northwestern Georgia. During the three decades 1880-1910 it progressed farther in a southwesterly direction, a distance of approximately 36 miles, to a point in Dekalb County in northeastern Alabama.

The latitude and longitude of the center of the Negro population at each of the five censuses for which its location has been determined, and the progression of the point in miles during the periods intervening between the censuses, is given in Table 12.

CENTER OF THE NEGRO POPULATION: 1790, 1880-1910.

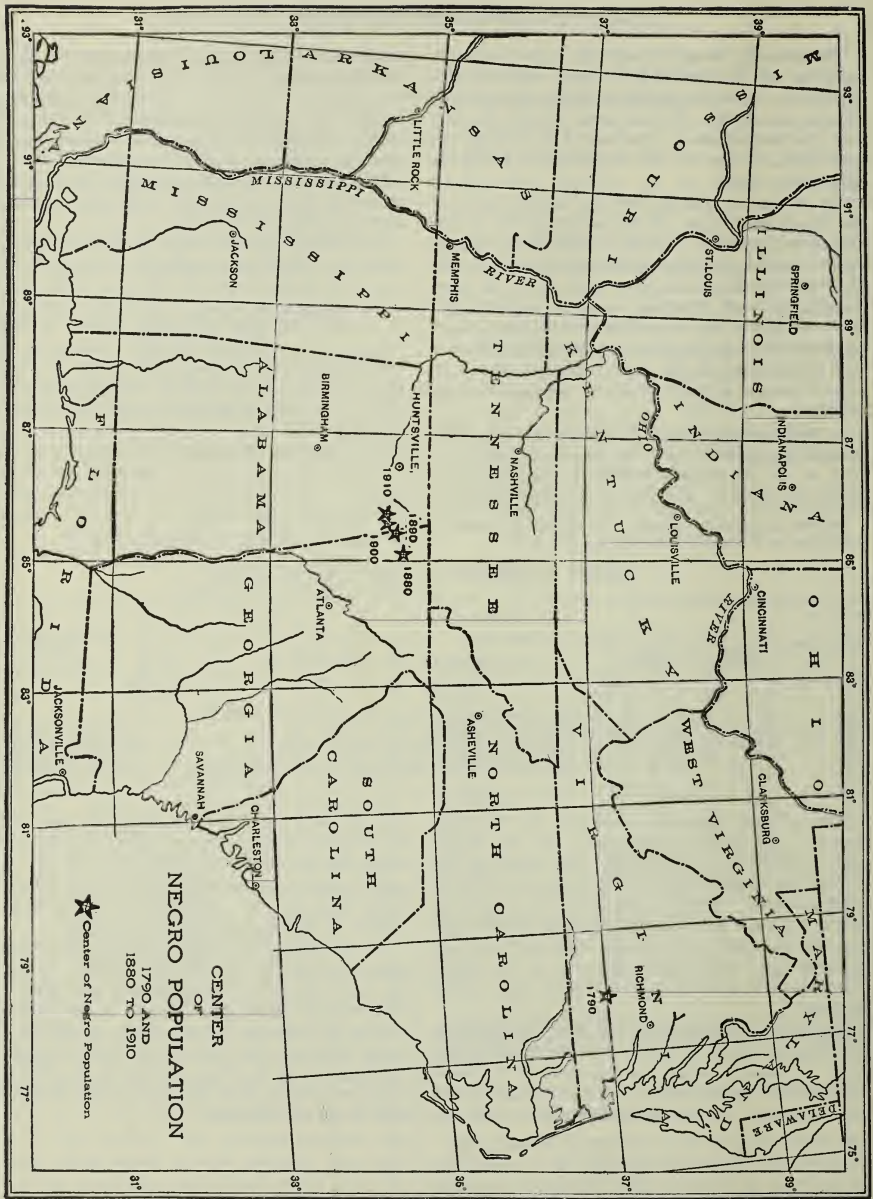

CENSUS YEAR.	LOCATION OF CENTER.						DECENNIAL MOVEMENT IN MILES.	
	North latitude.		West longitude.		Approximate location by important towns.			
	°	'	''	°		'	''	
1790.....	37	4	8	77	51	21	25 miles west-southwest of Petersburg, Dinwiddie County, Va.	
1880.....	34	42	14	85	6	56	10.4 miles east of Lafayette, Walker County, Ga.....	443 miles southwest.
1890.....	34	36	18	85	26	49	15.7 miles southwest of Lafayette, Walker County, Ga.....	20.5 miles southwest.
1900.....	34	31	16	85	34	35	10.7 miles northeast of Fort Payne, Dekalb County, Ala.....	9.5 miles southwest.
1910.....	34	30	0	85	40	43	5.4 miles north-northeast of Fort Payne, Dekalb County, Ala.....	5.8 miles west-southwest.

The average decennial movement for the nine decades 1790-1880 was 49.2 miles. In the decade 1880-1890 the center progressed 20.5 miles; in the decade following 9.5 miles; and in the decade ending in 1910, 5.8 miles. It will be noted that the progression of the point has retarded from decade to decade, that the advance made in the decade 1900-1910 was very inconsiderable, and that the direction of the movement veered from southwest to a course more nearly westerly.

Migration of Negroes from the South to Northern and Eastern states, in recent decades, as well as the large increases in certain eastern states of the South has retarded the movement of the center southward and westward. In general the retardation indicates

that the westward drift which, during the past century has characterized the Negro as well as the white population, has become less considerable, relatively to the settled population, although it does not necessarily follow from this that the number of migrants, or the volume of migration westward has declined.

It is undoubtedly true, also, that counter currents of migration have in recent decades partially neutralized the westward drift. The retardation in movement of the center is not inconsistent with an increasing proportion of migrants in the Negro population, but would indicate rather that the net result of migratory displacement in the Negro population is a dispersion of the population about the center rather than a mass drift in any one direction,

CHAPTER IV.—PROPORTION NEGRO IN THE POPULATION AT EACH CENSUS, BY STATES: 1790-1910.

PERCENTAGE DISTRIBUTION, BY RACIAL CLASSES, FOR SECTIONS AND DIVISIONS: 1910.

The percentage distribution of the population of divisions and sections in 1910, by racial classes, is shown in Table 1.

SECTION AND DIVISION.	All classes.	Negro.	White.			Indian.	Chinese, Japanese, and all other.
			Total.	Native.	Foreign born.		
United States.....	100.0	10.7	88.9	74.4	14.5	0.3	0.2

Mountain.....	100.0	0.8	99.7	79.1	16.6	2.9	0.6
Pacific.....	100.0	0.7	96.0	75.4	20.5	0.8	2.5

¹ Less than one-tenth of 1 per cent.

In the South, as a whole, 29.8 per cent of the total population in 1910 was Negro; in the North, 1.8 per cent; and in the West, 0.7. The proportion Negro was highest in the South Atlantic division, in which 33.7 per cent, or one-third of the population, was Negro. In the East South Central division the proportion was 31.5 per cent and in the West South Central, 22.6 per cent. The highest percentage in any northern or western division was 2.2, the lowest 0.7, these being the percentages for the Middle Atlantic and the Pacific divisions, respectively.

From these proportions it will be apparent that the Negro population is a much larger factor in the total population of the South Atlantic and East South Central states than it is in the West South Central states, and that in the North and West as a whole this class of the population is numerically relatively unimportant. It will be found, however, by reference to state tables (see, for example, Table 5, p. 51) that the proportion Negro in the population of certain Northern and Western states approaches the proportion in some Southern states much more nearly than the average for any

northern division approaches that for any southern division.

The Negro and white population combined constituted, in 1910, 99.7 per cent of the total population of the South, 99.8 per cent of the total population of the North, and 96.6 per cent of the total population of the West.

PERCENTAGE NEGRO, AND NEGROES TO 1,000 WHITES, BY SECTIONS AND DIVISIONS: 1790-1910.

In Table 2 the percentage Negro in the total population and the number of Negroes per 1,000 whites, at each census 1790-1910, is given by sections and southern divisions.

YEAR.	PERCENTAGE NEGRO IN THE POPULATION.

1800.....	233	539	603	212	32
1790.....	239	548	572	175	35

The percentage Negro in the total population of the South was lower in 1910 than at any preceding census. Making allowance for the omissions of 1870, the proportion Negro in the population of the South

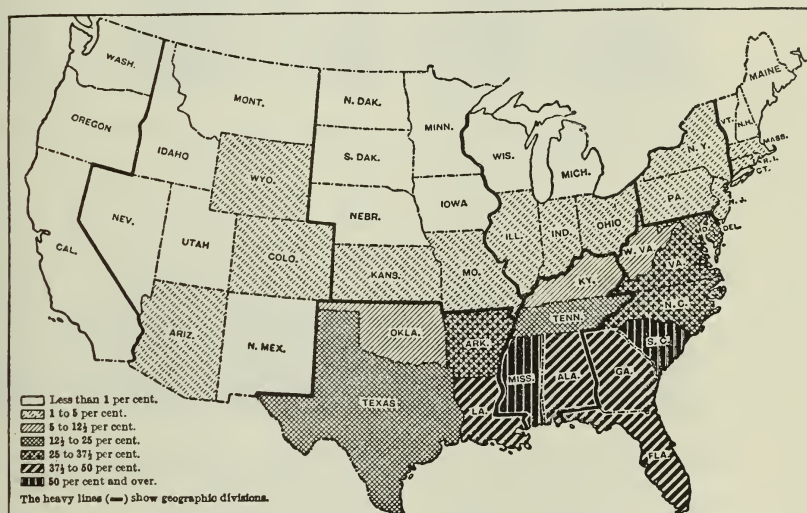

decreased, in each of the seven decades 1840-1910, from 38 per cent in 1840 to 29.8 per cent in 1910. In the period preceding 1840 the proportion increased in each of the four decades 1800-1840 from 35 per cent to 38 per cent, the proportion for 1790, 35.2 per cent, being slightly higher than that for 1800.

At each census the percentage Negro in the population of the South Atlantic division exceeded that in the population of the South, as a whole. In this division the percentage increased from 36.4 in 1790 to 41.9 in 1830 and fell off in subsequent decades to 33.7 in 1910. In the East South Central division the

percentage increased from 14.9 in 1790 to 34.7 in 1860 and declined to 31.5 in 1910. In the West South Central division the decline in the proportion has been continuous since 1810, except for an increase in the decade 1820-1830.

In the North the proportion Negro in the population has not changed materially since 1850, and it has not at any census since that date amounted to so much as 2 per cent. In this section the percentage declined from 3.4 in 1790 to 2 in 1850. At no census has the proportion in the West amounted to more than a fraction of 1 per cent.

PERCENTAGE NEGRO IN THE POPULATION, BY STATES: 1910.

The number of Negroes per 1,000 whites in the population of the South, as a whole, was 543 in 1790, it was 613 in 1840, and fell off in subsequent decades to 426 in 1910. In the population of the South Atlantic division there were 572 Negroes per 1,000 whites in 1790. The proportion rose to 723 in 1830 and declined to 510 in 1910. In the East South Central division the proportion rose from 175 per 1,000 in 1790 to 531 per 1,000 in 1860 and declined to 461 in 1910. At two of the earlier censuses the number of Negroes in the East South Central division exceeded the number of whites. The proportion for 1810 of 1,231 Negroes to 1,000 whites in this section is, however, in fact, the proportion for Louisiana, the only state or territory in the section for which returns

of population were made in this year. At the following census returns were made from Arkansas and in 1850 from Texas. In these states and in Oklahoma the growth of the white population has been exceptionally rapid, and the decrease in the proportion of Negroes to whites has been more marked than in either of the other two southern divisions.

In the North the number of Negroes per 1,000 whites was 35 in 1790 and 19 in 1910. In the West it has not at any census exceeded 9 to 1,000. In no northern or western division did the proportion of Negroes to whites in the population in 1910 exceed 22 to 1,000, the lowest proportion among the southern divisions being that for the West South Central division, of 295 per 1,000.

NEGRO POPULATION.

DIAGRAM I.—PERCENTAGE NEGRO IN THE POPULATION OF THE SOUTHERN STATES AT EACH CENSUS: 1790-1910.

PROPORTION NEGRO.

PERCENTAGE NEGRO AT EACH CENSUS, BY STATES:
1790-1910.

The percentage Negro in the population at each census 1790-1910 is given, for divisions and states, in Table 5. For states, in 1910, the percentage Negro in the population is presented graphically by the map on page 47, and for each of the Southern states at each census 1790-1910 by the diagram on page 48.

In Table 3 the percentage Negro in the population of the states is given, the states being ranged in order according to this percentage, and the Negro and white population cumulated by states.

Wisconsin.....	0.1	2,807	9,837,763	100.0	2,300,535	81,763,897	100.0		

More than one-half of the Negro population lived in states in which the proportion Negro in the population exceeded 40 per cent. These states reported only 6.7 per cent of the white population.

The percentage Negro in the population of the Southern states in 1910 ranged from 5.3 per cent in West Virginia to 56.2 per cent in Mississippi. The second highest percentage was that for South Carolina, in which state the percentage had declined during three decades from 60.7 in 1880—the maximum percentage shown for any state at any census in the period from 1790 to 1910—to 55.2 per cent in 1910.

NEGROES TO 100,000 WHITES AT EACH CENSUS, BY STATES: 1790-1910.

The number of Negroes per 100,000 whites at each census, 1790 to 1910, is given in Table 6, by divisions and states, the proportions shown in this table being derived from the populations given in Table 13 of Chapter III.

In 1910 the Negro population exceeded the white population in two states, namely, South Carolina and Mississippi. The number of Negroes to 100,000 whites was 123,070 in South Carolina and 128,415 in Mississippi. In South Carolina the Negro population has exceeded the white at each census, beginning with that of 1820, in which year the number of Negroes to 100,000 whites was 111,734. In the 60 years, 1820 to 1880, the proportion of Negroes to whites in the population of this state increased continuously from census to census, except for a slight decline in the decade 1850-1860, the number of Negroes to 100,000 whites in 1880 being 154,519. At each census since 1880 the proportion has declined. In Mississippi Negroes have constituted a majority of the population at each census, beginning with that of 1840. In the period of 60 years, 1840 to 1900, the proportion advanced with some fluctuation from 109,774 to 141,552. In Louisiana the proportion in 1830 was 141,208; it declined to 98,018 in 1860; increased to 106,309 in 1880; and decreased to 75,856 in 1910.

The proportion of Negroes to whites increased during the decade 1900-1910 in 20 states—3 Southern and 17 Northern or Western—it decreased in 28 states—13 Southern and 15 Northern or Western, and in the District of Columbia. Considered by states, the proportion of Negroes to whites in the South decreased generally during this decade, except in West Virginia, Arkansas, and Oklahoma. In partial explanation of these decreases in Southern states and of the increases in Northern states, it may be noted that there has been in recent decades some net migration of Negroes out of the South into the North, and some net migration of whites, native and foreign born, into the South. Interstate migration of both Negroes and whites within the South, as well as between the South and other sections of the country, is undoubtedly an important factor underneath changes in the proportion of Negroes to whites in the population of the several states.

NEGRO POPULATION.

Among the Southern states the proportion of Negroes to whites was lowest in West Virginia—5,547 Negroes to 100,000 whites—and highest in Mississippi—128,415. Among Northern and Western states it was highest in Missouri—5,022—whose proportion approached nearly to that of West Virginia. In 18

Northern and Western states the number of Negroes to 100,000 whites was less than 1,000, and in 10 of these states it was less than 500.

The Negro and white populations of the states in 1910 are classified in Table 4 with reference to the proportion of Negroes to whites in their populations.

NEGRO AND WHITE POPULATION OF STATES CLASSIFIED ACCORDING TO NUMBER OF NEGROES PER 100,000 WHITES: 1910 AND 1900.

Of the total Negro population, 18.8 per cent, or nearly one-fifth, in 1910 was living in the 2 states in which the number of Negroes to 100,000 whites in the population exceeded 100,000. These states reported 1.8 per cent, or less than one-fiftieth of the white population. One-half, or 50.4 per cent, of the Negro population in 1910 was living in the 6 states in which the number of Negroes per 100,000 whites exceeded 50,000. The aggregate Negro population of these 6 states in 1910 was 4,953,142, which slightly exceeded the Negro population of the 42 states and the District of Columbia, in which a lower proportion

of Negroes to whites prevailed. The aggregate white population of these two groups of states was 5,510,626 and 76,221,331, respectively. Of the white population in 1910, 22.8 per cent, or more than one-fifth, lived in the 18 states in which the number of Negroes per 100,000 whites was less than 1,000. Less than 1 per cent of the Negro population lived in these states. It may be noted that in 1900, 50.2 per cent, or one-half of the Negro population, was living in the 6 states in which the number of Negroes to 100,000 whites exceeded 75,000.

1 Dakota Territory.

1 Includes Indian Territory in 1900 and 1890.

CHAPTER V.—FREE COLORED AND SLAVE POPULATION: 1790-1860.

NUMBER AND INCREASE: 1790-1860.

Returns of free colored¹ persons and slaves were made at each decennial census from 1790 to 1860. This classification was essential to the observance of that article of the Constitution, which directed that representation in the House should be apportioned to the several states according to their population, including in the apportionment population all free persons except Indians not taxed, and "three-fifths of all other persons." In the first eight census reports data for the slave and for the free colored population were compiled in greater or less detail, the amount of detail shown for each class increasing from census to census, as the schedule inquiries and the compilations of the returns became more elaborate. At the censuses of 1850 and 1860, returns for the free colored were made in the same detail as for whites, a separate schedule carrying fewer inquiries than that pertaining to free persons being used in securing returns of slaves. With the abolition of slavery in the decade 1860-1870, the class of free persons came to embrace the entire Negro population, and at the census of 1870 the distinction relating to the status of the individual as being free or slave, which had characterized the returns of the Negro population at each preceding census, lapsed.

At the census of 1790 slaves were reported from all the states and territories enumerated with the exception of Vermont and Massachusetts—Maine being at that time a district of Massachusetts.

¹ In the earlier censuses the term "colored" is used to designate the Negro population.

² Slavery was introduced into the colonies in August, 1619, when African Negroes were brought to Jamestown by Dutch traders and sold to the planters of Virginia. At that time the sale of Africans who had been captured or purchased was sanctioned by the leading European nations and formed a very profitable business. The slave traders, taking advantage of the new field opened to them by the colonization of the coast of North America, introduced slavery into most of the colonies soon after they were founded. The only colony established with ordinances against this institution was Georgia; and this state also was soon forced, by social contact and business competition with the neighboring settlements, to legalize the holding of slaves.

The actual importations of slaves can only be estimated. Mr. Carey, author of a work on the slave trade, is the authority for the following estimate of the number of slaves imported:

PERIOD.	Number of slaves.	PERIOD.	Number of slaves.
Total.....	333,000	1751 to 1760.....	35,000
Prior to 1715.....	30,000	1761 to 1770.....	74,000
1715 to 1750.....	90,000	1771 to 1780.....	34,000
		1781 to 1808.....	70,000

It is claimed, however, that this total is too small, and that a closer estimate would bring the number to 370,000, or even 400,000. Mr.

The number of free colored persons and slaves as returned at the first eight censuses is given, by states, in Table 6, on page 57. Tables 21 and 22 of Chapter XI, classify the free and slave population of divisions and states in 1860 and 1850, as black and mulatto, the distinction of sex being shown on the table for 1860.

For the country as a whole, the free and slave population at each census is given in Table 1 following, together with decennial increases.²

CENSUS YEAR.	Total.	Free.		Slave.	Decennial increase.			
		Number.	Per cent.		Number.		Per cent.	
					Free.	Slave.	Free.	Slave.
1860.....	4,441,830	488,070	11.0	3,953,760	53,575	749,447	12.3	23.4

	1,757,181	90,557	7.9	697,624

¹ In other sections of this report and in census reports generally the total Negro population in 1790 is given as 757,208. The population given in Table I is taken from "A Century of Population Growth in the United States, 1790-1900," and is a revised figure.

The number of free colored persons increased in each decade of the period covered by Table 1. During the two decades 1790-1810 the rate of increase for this class exceeded that for slaves, and the proportion free

Carey's figures indicate that the average annual importation was about 2,500 between 1715 and 1750 and 3,500 for the period from 1751 to 1760. The following decade was the period of greatest activity, the importation reaching an average of 7,400 a year. For the 20 years from 1771 to 1790 the average fell to 1,700, but for the period immediately preceding the legal abolition of the slave traffic in the United States it was more than double that number. By 1790 the survivors and descendants of the African slaves imported numbered 757,208, according to the Federal census of that year.

Early in the history of the Southern colonies the planters realized that slave labor could be utilized to good advantage in the cultivation of tobacco and some other crops. (The cotton crop, which later furnished an extensive field for slave labor, did not assume great importance until the invention of the cotton gin in 1793. After that date the employment of slaves in the cultivation of cotton became especially profitable, since this crop furnishes work for a considerable portion of the year and makes it possible to utilize to advantage the services of women and children.) At the beginning of the eighteenth century Negro slavery was considered by the settlers of all of the colonies as a usual and routine matter, and in the New England and Middle colonies, as well as in the South, the possession of slaves was generally accepted as an evidence of wealth and of importance in the community.

By 1790 Negro slavery was recognized by law in every North American colony. At the time of the Declaration of Independence the British possessions had local enactments protecting slave property and providing special codes and tribunals for slaves. Some of

in the Negro population accordingly rose, from 7.9 per cent in 1790, to 13.5 per cent in 1810. Although the Negro population more than doubled during the 30 years, 1810-1840, the proportion free in this population remained nearly constant. This proportion, however, fell off in each of the two decades 1840-1860, to 11.9 per cent in 1850, and to 11 per cent in 1860.

Of the total Negro increase during the decade 1790-1800, 20.8 per cent, or more than one-fifth, was in the free population, the proportion free in the increase of the decade following also being approximately one-fifth. In succeeding decades, free colored persons constituted a less considerable factor in the Negro increase, only 6.7 per cent, or one-fiftenth of the Negro increase in the decade 1850-1860, being in the free population.

The increase of the free colored population during this period of 70 years was in part a natural increase by excess of births over deaths among the free colored; in part, an increase by accessions from the class of slaves, through private or general-law manumission, purchase, and escape of slaves to free territory; and for several decades, in part, an increase by extension of the area of census enumeration. Only 7,011 free colored persons in 1860 were foreign born—3,700 or more than one-half of these being in the state of New York—and it seems probable from such data as are available that neither the net immigration nor the net emigration of free Negroes in the immediately preceding decades had been so considerable as materially to affect the rate of increase for this class.

The number of slaves manumitted during the year preceding the census of 1850, as returned on the census schedules, was 1,467; the number becoming fugitive in this year was 1,011; the number of manu-

missions reported for 1860 was about 3,000, and the number becoming fugitive during that year, 803. The census of 1860 states that 20,000 manumissions "are believed to have occurred in the past 10 years."

The increase of the free colored population, although in this class natural growth was continuously supplemented by accessions from the slave population, was nevertheless insufficient in the decades immediately preceding the Civil War to produce a rate of growth equal to the natural increase of the Negro population as a whole. In the decade 1840 to 1850, the percentage increase of the slave population was more than double and in the decade following nearly double that of the free colored. The Compendium of the Seventh Census (1850) commented upon the "declining ratio of the increase of the free colored in every section," which in New England "is now almost nothing," and in the Southern states "only one-fourth as great as between 1800 and 1810." The report of 1860, also, noted that the rate of increase of the free colored had been gradually declining for several decades, "to 1860, when the increase throughout the United States was but 1 per cent per annum."

Census data do not very clearly account for this decline in the rate of increase of the free element in the Negro population, so far below the rate for the slave population, but it may be noted that, as compared with the slave population, the free colored were somewhat older, and on that account naturally subject to a higher mortality rate, and somewhat less normally distributed by sex, and, therefore, probably characterized by a marital condition less favorable to rapid natural increase. Among the free colored at each of the five censuses 1820 to 1860 there were fewer

the slave codes were extremely severe, because of the fear of Negro insurrections.

Although slavery became the presumptive status of every Negro, most of the colonies recognized the status of free Negroes. But the presence of a free Negro was believed to have an unfavorable influence on the slaves in the neighborhood, and hence many of the colonies made the conditions surrounding manumission so exacting that slave owners seldom took advantage of the legal right to free their slaves. There are, however, numerous instances of Negroes who were freed by their masters, and some cases of Negroes who were given their freedom by the state on account of some public service performed by them; but no data are available as to the aggregate number of slaves manumitted.

Free Negroes were allowed property rights, and, consequently, some of them became slave owners. Often a manumitted Negro would purchase the freedom of the members of his family or of friends, and unless he went through the formality of manumission these persons were legally his slaves.

* * * * *

The first petition against slavery recorded in American history was made in 1688, by Friends, in Germantown, Pa. The agitation against slavery was continued by other Quakers, by the Puritans, and by groups of individuals here and there. As the direct result of this movement, prohibitive duties on the importation of slaves were imposed by Pennsylvania in 1712, and also by other colonies from time to time. (In some colonies the duty on a slave brought from another colony was several times that on a slave imported directly from Africa or from the West Indies; the impression appears to have existed that slaves were sent from one colony to another because of undesirable qualities, or because they had committed crimes, and that the colony which deported them was taking this way of ridding itself of their presence.)

Since the slave trade was a source of revenue to British merchants, and even to the Crown, legislation against it was distasteful to the British Government, and objections were raised on account of the legislative action of the colonies. The governors sent to South Carolina in 1756 and 1761 bore instructions prohibiting the enactment of any law imposing duties on imported Negroes.

By 1778 legislative measures prohibiting the slave trade had been passed by all of the New England and Middle states, and by Maryland and Virginia; by 1798, similar action had been taken by every other state, although the trade was afterwards revived in South Carolina.

The first assumption of national control of the slave trade came in 1774, when the Continental Congress passed a resolution to abolish it. In 1793 the convention that framed the Constitution made plans for the abolition of this traffic in 1808, and later the first day of 1808 was chosen as the time when the slave trade should become illegal.

The first action against the ownership of slaves was taken by Vermont. In its Declaration of Rights, in 1777, this colony declared for the freedom of all persons at the age of maturity; a few years later it took a more definite stand, abolishing slavery outright. By 1783 slavery had been prohibited in Massachusetts and New Hampshire. Gradual emancipation was provided for in acts passed by Pennsylvania in 1780 and by Connecticut and Rhode Island in 1784. In 1787 slavery was forbidden in the Northwest Territory by congressional legislation, although the courts held that the ordinance did not free the slaves already held in the territory. By the date of the first Federal census laws providing for the extinction of slavery had been put into operation in all states north of Maryland, with the exception of New York and New Jersey.—*A Century of Population Growth*, pp. 36-37, Bureau of the Census: 1909.

FREE COLORED AND SLAVE POPULATION.

males than females, while in the slave population, on the other hand, at each of these censuses the number of males exceeded the number of females. In 1850, however, the slave population of over 3,000,000 was so evenly divided by sex that the excess of males over females amounted to less than 1 in 4,000 population. In this year the sex ratio in the free colored population was 924 males to 1,000 females, the relative deficiency of males being practically confined to the population 15 years of age and over; in the slave population it was 1,000 males to 1,000 females; in 1860 the ratio

was 922 males to 1,000 females in the free colored, and 1,006 males to 1,000 females in the slave population. The disparity of numbers between the sexes was thus in both years much greater in the free colored population.

DISTRIBUTION BY SECTIONS AND SOUTHERN DIVISIONS: 1790-1860.

In Table 2 the free colored and slave population at each census from 1790 to 1860 is given, by sections and southern divisions.

¹ Less than one-tenth of 1 per cent.

At the census of 1790, 92 per cent of the slave population was in the South Atlantic division; 2.3 per cent was in the East South Central division; and 5.7 per cent were in the North. At succeeding censuses the proportion in the South Atlantic division fell off, with the growth of population in the East South Central and West South Central divisions. In 1860, 46.5 per cent of the slave population was in the South Atlantic division; 34.7 per cent in the East South Central division; 15.8 per cent in the West South Central division; and 2.9 per cent in the North. The Northern and Western states reporting slaves in 1860, and the number of slaves reported were as follows: New Jersey, 18; Missouri, 114,931; Nebraska, 15; Kansas, 2; Utah, 29.

Of the free colored population in 1860, 46.2 per cent was in the North and 44.6 per cent in the South Atlantic division. The proportion in the East and West South Central divisions—4.4 and 3.9 per cent, respectively—was much smaller than the proportion of slaves in these divisions.

FREE AND SLAVE POPULATION OF FOUR CITIES: 1790.

The Negro population of New York, Philadelphia, Boston, and Baltimore in 1790 is classified as free and slave in Table 3.

CITY.	POPULATION: 1790.				
	Total.	Negro.			White.
		Total.	Free.	Slave.	
New York.....	32,305	3,262	1,078	2,184	29,043
Philadelphia.....	28,522	1,630	1,420	210	26,892
Boston.....	18,038	761	761	17,277
Baltimore.....	13,503	1,578	323	1,255	11,925

In 1790, of the 3,252 Negroes reported from New York City and constituting 10.1 per cent of the total population of the city, 2,184 were slaves and 1,078 free colored. Philadelphia reported in this year a Negro population of 1,630, the number of slaves being 210 and of free colored 1,420; Baltimore, a Negro population of 1,578, the number of slaves being 1,255,

NEGRO POPULATION.

and of free colored 323; Boston, a Negro population of 761, all free. The slave population of New York City in 1790 exceeded that of Baltimore, and the proportion slave in the population of Baltimore was not materially greater than in that of New York City, being 9.3 in Baltimore, as compared with 6.8 percent in New York City.

SLAVEHOLDING AND NONSLAVEHOLDING FAMILIES:
1790 AND 1850.

On the schedules of the census of 1790, which are in existence, there is reported a total of 5,161 free colored families, of which 195 are designated as slaveholding families.¹

The following table gives a summary of the data available for 1790, as regards the number of slaveholding and of nonslaveholding families, in the free colored and the white population.

¹ Estimated. ² Includes area now West Virginia. ³ Data not available.

The figures given for 1790 in Table 5 include estimates for certain areas for which data gathered in 1790 are not now available.

In the 60 years, 1790 to 1850, the number of slaveholding families in the United States increased from 96,168 to 347,725. At the First Census, New England reported 2,147 slaveholding families and the three Middle Atlantic states, 14,414. No slaveholding families were reported from the states of these divisions in 1850, except for 200 such families in New Jersey, and none from any other Northern states, except Missouri, which in this year reported 19,185 holders of slaves. A few slaves were, however, held in Utah, although the number of slaveholding families is not given.

CHAPTER VIII.—THE "BLACK BELT."—NUMBER, INCREASE, AND DENSITY, BY COUNTY AREAS...	108

CHAPTER VI.—NATIVITY—PLACE OF BIRTH, PARENTAGE, AND INTERSTATE MIGRATION.

THE NATIVITY INQUIRY.

The nativity inquiry of the population schedule calls for a statement of place of birth of persons enumerated, and of their parents. In the case of natives the state or territory of birth is designated, and in the case of foreign-born persons the country of birth.

Upon the basis of the returns under this inquiry the population is classified as native and foreign born and the native population is further classified as of native, foreign, or mixed parentage. Finally the foreign-born population is classified by country of birth, and the native population by state or territory of birth.

Data relating to nativity have been returned at each census beginning with that of 1850, at which census the state or country of birth of each free inhabitant was recorded for the first time at any decennial enumeration. The place of birth of parents was called for first at the census of 1870.

NATIVE AND FOREIGN BORN: 1850-1910.

At the censuses of 1850 and 1860 the nativity inquiry was included in the schedule for free inhabitants only, embracing free colored persons (Negroes) to the number of 434,495 in 1850 and 488,070 in 1860. For nearly nine-tenths of the total Negro population no nativity data are available covering these years.

In Table 1, classifying the Negro population as native and foreign born, the entire slave population of 1850 and 1860 is classified as native, together with the free colored returned as native on the schedule for free inhabitants.

YEAR.	NEGRO POPULATION.				WHITE POPULATION.	
	Total.	Native. ¹	Foreign born.		Number foreign born.	Percentage foreign born.
			Number.	Per cent.

1850.....	3,638,808	3,634,741	4,067	0.1	2,240,335	11.6

¹ Includes all slaves and native free colored.

The 40,339 foreign-born Negroes in 1910 constituted 0.4 per cent of the total Negro population. In 1900 the foreign-born Negro population numbered 20,336, the increase for the decade being 20,003. At no census for which data are available has the foreign-born element in the Negro population amounted to so much as one-half of 1 per cent.

In Table 2 the native and foreign-born Negro population of the United States is given, by sections and divisions, for 1910.

Pacific.....	29,195	28,021	1,174	2.9	6.5	4.0	21.4

¹ Less than one-tenth of 1 per cent.

As is true in the case of the white population, the foreign-born Negro population in 1910 was largely resident in the North, the proportion living in the North being 84.8 per cent for the foreign-born white population and 70 per cent for the foreign-born Negro population.

Of the Negro population in the South, only one-tenth of 1 per cent was foreign born, the corresponding proportion for the North being 2.7 per cent, and for the West, 3.1 per cent. The highest proportion foreign born for the Negro population is that of 11.6 per cent for New England.

Table 3 gives the foreign-born Negro population by states, in 1910 and in 1900, with the increase for the decade 1900-1910.

PARENTAGE: 1910 AND 1900.

In Table 4 the native and the foreign-born Negro population in 1910 and in 1900 is classified according to parentage, data for the white population being introduced for comparison.

Of the total Negro population in 1910, 9,787,424 or 99.6 per cent were native, and 9,748,439 or 99.2 per cent were native of native parents; the number born of foreign parents being in both years inconsiderable. In 1910 the number born with one or both parents foreign born was 38,985, or 0.4 per cent.

		All other.....	39

¹ Except Porto Rico. ² Except Hawaii and Philippine Islands.

More than half of the foreign-born Negroes were natives of Cuba and other West Indies; 6,775 were natives of Canada and Newfoundland; and 1,184 were natives of Mexico. The total from North and South American countries was 33,233, and for European countries 3,861.

NATIVE POPULATION REPORTING STATE OF BIRTH.

Of the 9,787,424 native Negroes resident in the States in 1910, 9,783,986 were born in the States and 3,438 in outlying possessions, or at sea under the flag, or abroad of American parents. Of those born in the States, state of birth was reported by 9,746,043, leaving 37,943 for whom no report of state of birth was made. The tabulations following, classifying the population in 1910 by state of birth, relate to this aggregate Negro population which embraces the small number born outside of the States but does not include the foreign-born resident in the States.

In Table 6 this native Negro population is shown for sections and southern divisions.

DIVISION AND SECTION.	NATIVE NEGRO POPULATION: 1910.

¹ Includes those for whom no report of place of birth was made.
² Includes 4 persons born in Alaska, 1 in Guam, 58 in Hawaii, 119 in the Philippine Islands, 173 in Porto Rico, 217 born at sea under the United States flag, and 2,596 American citizens born abroad.

CLASSIFICATION BY STATE OF BIRTH: 1850.

As has been noted, state of birth was recorded first at the census of 1850. Tables 7 and 8 are reproduced from the Compendium of the 1850 census as being the first state of birth tables prepared by the Census Bureau relating to the Negro population. In Table 7 the free colored population is classified by sex, and as born in the state of residence, born out of the state of residence in the United States, and born in foreign countries. In Table 8 the nativities of the free colored population of Connecticut and Louisiana, and of the cities of New York and New Orleans, are shown, the state and country of birth being designated for the black and mulatto population of these two states and two cities—a northern state and city in comparison with a southern.

The data given in Tables 7 and 8 are, of course, not comparable with the data given for succeeding census years, since the return of nativity in 1850, as has been noted, embraced only a small proportion of the Negro population.

Out of 7,693 free colored persons in Connecticut, 1,798 were mulattoes, of whom 48 were born in the slave States. Out of 13,815 free colored in New York City, 3,066 were mulattoes. Thus, in both instances, the mulattoes constituted less than one-fourth of the free colored population. About one-fifth of the free colored in New York were born in the present slave States.—*Compendium of the Seventh Census, p. 89.*

POPULATION BORN IN THE SOUTH: 1870-1910.

In Table 9 the native Negro population is classified as born in the South and born in the North and West, at each census, 1870 to 1910. The proportion of the total native Negro population born in the South in 1910 was practically the same as in 1870, the percentage in 1870 being 93.4 and in 1910, 93.1. A nearly identical proportion obtained at each of the five censuses covered by Table 9, the percentages for the several years being 93.4, 93.3, 92.5, 93.2, and 93.1. The proportion born in the North and West ranged from 6.4 to 6.7.

Certain of the figures given in Table 9 are estimates. This is true of the number born in the South and in the North and West for 1890 and for 1880, and of the percentages based upon these populations. For these years statistics are available for the aggregate colored population only. The process of estimating is explained in a note attached to Table 12 (p. 66). It may be observed that while the process of estimating

involves a number of small eliminations of Indians, Chinese, and Japanese from the aggregate colored,

¹ Includes persons born in the United States, state of birth not reported; born in outlying possessions; born at sea under the United States flag; American citizens born abroad; and, for 1890, the colored population specially enumerated in Indian Territory and on Indian reservations, for whom no return of state of birth was made. ² Figures in italics are estimates. (See Note 2, Table 12, p. 66.)

the numbers in these several classes are so inconsiderable, relatively to the total Negro population, that the error in the estimates for Negroes is negligible. The principal effect of the estimating for each year is exclusion of the native Indian population of the North and West from the aggregate native colored population of these sections. Data for the colored in 1890 and in 1880, upon which the estimates for Negroes are based, are given in Table 9.

MIGRATION FROM AND TO THE SOUTH.

Table 10 shows for each of the five census years, 1870 to 1910, the number of Negroes born in the South living in the North and West, and the number born in the North and West, living in the South. In this table, as in Table 9, figures for Negroes in 1890 and in 1880 are estimates, the margin of error in the estimates being probably no greater than the error in enumeration of the Negro population in other census years.

Table 10

1870.....	4,548,991	149,100	3.3	319,897	15,583	4.9

¹ Figures in italics are estimates. See Note 2, Table 12 (p. 66).

Of the Negro population born in the South 440,534, or 4.8 per cent, were living in the North and West in 1910. This number indicates a very considerable dispersion of the Negro population born in the South through other sections of the country.

The migration to the South of Negroes born in the North and West, while it is less considerable in volume than the migration out of the South, is, relatively to the Negro population born in the North and West, somewhat greater than the migration out of the South, relatively to the Negro population born in the South. The 41,489 Negroes born in the North and West and living in the South in 1910 constituted 6.5 per cent of the total Negro population born in the North and West, the corresponding proportion for migrants born in the South being, as noted above, 4.8 per cent.

Each decennial period covered by Table 10 shows a substantial increase in the number of natives of the South living in the North and West. In the period of 40 years, 1870-1910, this number increased from 149,100 in 1870 to 440,534 in 1910. In the same period the number born in the North and West living in the South increased from 15,583 to 41,489.

It should be understood that the 440,534 natives of the South living in the North and West in 1910 do

not embrace the total number of migrants out of the South during any given period. Among migrants leaving the South during any period prior to the Census of 1910 a certain number died before the taking of the 1910 census, and of the survivors those only were returned as migrants out of the South who had not returned to the South or migrated from the North or West to an outlying possession or to a foreign country. It is clear, therefore, that the number of migrants leaving the South in recent years very considerably exceeds the number found living in the North and West at the last census. Similarly, it is true that the number of migrants to the South in recent years exceeds the number of natives of the North and West enumerated in the South.

The net gain of the North and West and loss of the South by interstate migration of Negroes is shown for each of the last five census years in Table 11.

Table 11

YEAR.	NATIVE NEGRO POPULATION.					
	Born in the South and living in the North and West.		Born in the North and West and living in the South.		Net gain of the North and West and loss of the South.	
	Number.	Increase.	Number.	Increase.	Number.	Increase.
1910.....	440,534	90,883	41,489	11,092	399,045	79,791
1900.....	319,651	107,706	30,397	7,129	319,254	809,667
1890.....	241,625	45,829	25,268	1,229	118,557	-57,408
1880.....	198,029	45,829	25,039	6,459	175,960	45,473
1870.....	149,100	15,583	133,517

¹ Figures in italics are estimates. See Note 2, Table 12 (p. 66).

The net migration out of the South to the North and West amounted in 1910 to 399,045. That is to say, if every Negro inhabitant born in the United States and living in the United States in 1910 had returned to his or her state of birth, the North and West would have lost the 440,534 natives of the South and would have gained the 41,489 natives of the North and West living in the South, suffering a net loss equal to the difference between these two numbers, 399,045. The net gain of the North and West in 1900 was 319,254, the increase in the net gain during the decade 1900-1910 being 79,791. In the successive decades the net gain of the North and West and loss of the South has increased from 133,517 in 1870 to 399,045 in 1910.

The increase in the number of migrants shown for each of the four decades should not be confused with the volume of migration as between the North and West, and the South. The increase for the decade 1900-1910, for example, of 90,883 in the number of Negroes born in the South living in the North and West is the excess of 1910 over 1900 in the number of such migrants reported. Migration during the decade must have been sufficient to cover (1) mortality during the decade among migrants living in these sections of the country in 1900; (2) returns of migrants to the South, and (3) emigration of migrants to foreign countries and to outlying possessions. Under any

NEGRO POPULATION.

assumption of a constant stream of migration from the South to the North and West during any considerable period of time, the population living in the North and West born in the South would tend to become stationary, and the increase in the number born in the South would disappear at that point where the number of migrants entering a section exactly equaled the mortality during the period covered. If, therefore, the number of natives of the South living in the North and West were to become stationary, the implication would be not that migration had ceased but that a condition had been reached in which the continuing migration exactly offset the mortality in the migrant population resident in the North. Obviously the volume of migration required merely to offset mortality without providing any increase, increases as the population native of the South and resident in the North and West increases.

The number of migrants in the Negro population as in other classes of the population tends to increase with population, that is to say, the number of natives of the North and West living in the South, for example, tends to increase as the population living in the North and West increases, and the population native of the South living in the North and West tends to increase with the population of the South. This would be true unless the tendency on the part of the Negro population to migrate from state to state was itself diminishing, the fact being that this tendency is rather increasing, as is shown by the percentages of Table 10.

The net gain of the North and West by interstate migration, as shown in the census returns, does not of course measure the full population gain of the North and West directly and indirectly attributable to migration in recent years, since that full gain must include not only migrants themselves but, as well, the children of migrants born subsequently to migration. It should be borne in mind also that the increase in the net gain shown for the several decades does not equal the net migration in these decades. The increase of 79,791 for the decade 1900-1910, for example, does not indicate a net migration of 79,791 during this decade, since the net migration into this section during this decade must have been sufficient to cover not only the net gain shown, but also deaths among the migrants during the decade, and deaths, returns to the North, and migrants among the population returned in 1900 as resident in the North and West and born in the South.

PROPORTION OF MIGRANTS IN THE SOUTH AND IN THE NORTH AND WEST.

In Table 12 statistics similar to those given in Table 9 for the United States as a whole are given for the South and for the North and West. This table shows, for example, that of the total native Negro population of 8,738,858 living in the South in 1910, 8,668,619 were born in the South and 41,489 were born in the

North and West. Of this Southern native Negro population, therefore, 99.2 per cent were born in the South and only 0.5 in the North and West. Of the 1,048,566 native Negroes living in the North and West in this year, 440,534 were born in the South and 595,401 in the North and West, the percentage born in the South being 42 and the percentage born in the North and West 56.8. Corresponding data are given for each of the last five censuses.

It may be noted as regards the Negro population of the North and West that the percentage born in the South increased from 33.8 in 1890 to 42 in 1910, the proportion for the earlier years being approximately the same as in 1890.

¹ See Note 1, Table 9 (p. 64).

* Figures in italics are estimates. It is assumed that in 1890 two-thirds—approximately the proportion in 1880—of the foreign-born Negro population of 19,970 lived in the North and West, and one-third in the South; that of the Indians, Chinese and Japanese, the same proportion of the native as of the total in each class lived in the North and West, and in the South, respectively, and that the natives of these classes resident in the North and West were born in the North and West, and the natives resident in the South were born in the South. As practically all—i. e., 57,571 out of 58,906—of the native civilized Indians included in the aggregate colored distributed by state of birth, were native, the error in the assumption that the same proportion of the natives as of the total lived in the South and in the North and West is immaterial. The great mass of the Indian population in 1890—189,447 out of 248,253—were specially enumerated, and for these state of birth was not reported. They are included under "Other colored" in Table 9. The number of native Chinese and Japanese is so small—i. e., 2,330 Chinese and 115 Japanese—that any error in distributing them as living in and born in the North and West, or South, is immaterial in its effects upon the figures for the native Negro population of 1910. In the 57,571 civilized native Indian population, 2,930 Chinese and 115 Japanese included in the aggregate native colored population of 7,510,680 in 1890, there were undoubtedly a few migrants into and out of the South. These are not taken into account in the estimate, but their number could not have been sufficiently large materially to affect the figures for the aggregate Negro. Similar assumptions are made for 1880, except that for this year the number of native Negroes, Indians, Chinese, and Japanese, living in each state is given in the report for 1880, and the number living in the South and in other sections is, therefore not as regards natives in these classes an estimated number, as it is for 1890. For 1880, therefore, it is assumed in the estimate that the 6,299 native Indians, Chinese, and Japanese returned as resident in the South were natives of the South, and that the 59,504 resident in the North and West were native of the North and West.

* Less than one-tenth of 1 per cent.

INTERSECTIONAL MIGRATION.

In Table 13 the native Negro and the native white population are classified according to section of residence and section of birth.

As regards the Negro population, Table 13 is to be read as follows: In the total native Negro population in 1910, numbering 9,787,424, there were returned 9,109,153 as born in the South, 621,286 as born in the North, and 15,604 as born in the West; the remaining

41,381 includes those for whom state of birth was not reported, those born in outlying possessions, born at sea under the United States flag, and American citizens born abroad; of the 9,109,153 born in the South 8,668,619 were living in the South; 415,533 were living in the North, and 25,001 in the West. Similar data are given for the white population, and for each of the three geographical sections.

Of the native Negro population of the South 99.2 per cent were born in the South; of the native Negro population of the North, 41.6 per cent were born in the South; and of the native Negro population of the West, 50.9 per cent were born in the South, and 24.3 per cent in the North.

Of the native Negro population born in the South, 95.2 per cent were living in the South, 4.6 per cent in the North, and 0.3 per cent in the West; of the native Negro population born in the North, 91.8 per cent were living in the North, 6.3 per cent in the South, and 1.9 per cent in the West; of the native Negro population born in the West, 69.8 per cent were living in the West, 15.5 per cent in the South, and 14.7 per cent in the North. The proportion of intersectional migrants is, it appears, somewhat smaller for Negroes born in the South (4.9 per cent), than it is for Negroes born in the North (8.2 per cent), the proportion of such migrants being greatest (30.2 per cent) among the small number of Negroes born in the West.

In Table 14, on the following page, the migration of Negroes out of and into the South is shown by divisions and states for each of the five census years, 1870 to 1910.

The table shows, for example, for the state of Maine, that there were living in the state, in 1910, 178 Negroes born in the South; the number born in the South living in this state decreased by 34 during the decade 1900-1910, and was less in 1910 than it was in 1870, in which year there were living in the state 366 Negroes who were natives of the South.

Among the Northern states Pennsylvania showed, in 1910, the largest Negro population born in the South, the number of Negroes born in the South living in this state being 97,020. New York showed the second largest population born in the South, with 60,494; Illinois the third largest, with 50,314; Ohio the fourth, with 44,439; and New Jersey the fifth, with 40,987.

Except in five Northern states the Negro population born in the South increased during the decade 1900-1910. Of these five states in which the number decreased, four are New England states (Maine, New Hampshire, Massachusetts, Rhode Island) and one (Kansas) is in the West North Central division. The largest increases are in the Middle Atlantic states and in Illinois.

The distribution of the Negro population born in the North and West among the Southern states is shown in the lower portion of Table 14. The Southern state reporting the largest number of Negroes born in the North and West was Oklahoma, the number of such natives being 6,096; Texas reported 4,158; Kentucky, 3,735; and Arkansas, 3,690. In every Southern state during the decade 1900-1910 the number of Negroes native of the North and West increased, the aggregate increase being 11,092.

NATIVITY.

INTERDIVISIONAL MIGRATION.

In Table 15 the migration of the Negroes is tabulated by geographic divisions. This table shows, for example, that in 1910 of the 37,799 Negroes born in New England, 30,815 were living in New England, and

6,984, or 18.5 per cent, were living in other divisions; that of the 58,109 Negroes living in New England, 27,294, or 47 per cent, were born in other divisions; that the net gain of the New England states through interdivisional migration in 1910 amounted to 20,310.

INTERDIVISIONAL MIGRATION OF THE NEGRO POPULATION.

The number of Negroes born in the South Atlantic division living in other divisions in 1910 was 448,140, or 10 per cent of the total Negro population born in the South Atlantic division. Of Negroes born in the East South Central division 352,991, or 12.4 per cent, were living in other divisions. The largest proportion living in other divisions was shown by the Mountain division, with 43.9 per cent of its native Negro population living in other divisions.

Seven of the nine geographic divisions had gained by migration from other divisions and two, namely, the South Atlantic and the East South Central, had lost population as the result of interdivisional migration. The net loss of the South Atlantic division amounted in 1910 to 392,827 and the net loss of the East South Central division to 200,876. The losses of these two divisions, of course, exactly equaled the gains of the other seven divisions.

Turning to that portion of the table which shows the proportion of interdivisional migrants in the resident population it will be noted that the proportion of such migrants is very high in the two far western divisions, being 80 per cent in the Mountain division and 77.7 per cent in the Pacific. More than half of the Negro population of the Middle Atlantic and East North Central divisions (52.3 and 50.4 per cent) and nearly half (47 per cent) of that of New England were born outside the division of residence.

Table 16 shows for 1910 and 1900 the native Negro population classified according to division of nativity. It shows, for example, that the Negro population native of the South Atlantic division and resident in the United States increased in the decade 1900-1910 from 4,125,476 to 4,487,313, the increase amounting

to 361,837. The corresponding increase for the East South Central division was 219,705 and for the West South Central division 311,153. In 1910 per 1,000 native Negroes resident in the United States 458 were born in the South Atlantic division, the proportion born in this division having decreased during the decade from 468 per 1,000.

Although the number born in any division is not affected directly by interdivisional migration, the increase of the population native of any division is affected indirectly by such migration—the percentage increase tending to be relatively high in divisions in

which population is increasing by net immigration from other divisions—since the children born of migrants in any divisions are natives of the division, as well as children born of natives of the division. The two divisions which showed for the decade 1900–1910 a net loss of Negro population by interdivisional migration showed percentages of increase below the average for the Negro population as a whole—the increase being 8.8 per cent for the South Atlantic division, and 8.4 for the East South Central—while the number of Negroes born in the Mountain division increased in the same period by 80.7 per cent.

INTERSTATE MIGRATION.

The preceding tables have classified the Negro population by nativity and residence, with reference to the several geographic sections or divisions of the country, showing for these large areas the displacement of population by migration. The full detail of nativity by state of birth and of residence in 1910 is given in Table 20 (p. 75), which by lines, distributes the native Negro population living in each division or state by division and state of birth, and, by columns, the Negro population born in each division or state by division or state of residence. From the detailed distributions of Table 20 the 1910 aggregates of the preceding tables, for the country as a whole, and for the several sections and divisions have been composed, no account being taken in them of intradivisional migration; that is to say, of migration from state to state within the several geographic divisions. Table 17, which classifies the Negro population born in each state as living in the state or in other states, and the native Negro population living in each state as born in the state or in other states, covering the years 1910 and 1900, embraces this intradivisional, together with the interdivisional migration.

As regards the state of Delaware, for example—and similar data are given for each of the other states—Table 17 shows that there were, in 1910, living in the United States 32,664 Negroes who were natives of the state of Delaware; that of this population native of Delaware 9,996, or 30.6 per cent, were living in other states, and 22,668 were living in Delaware; that the native Negro population of Delaware numbered 31,067, of whom 8,399, or 27 per cent, were born in other states, and 22,668, as already noted, were born in Delaware; that the net loss of the state by interstate migration—i. e., the excess of the population born in the state over the population living in the state, or of the population born in Delaware and living in other states, over the population born in other states and living in Delaware—was 1,597; that the number of Negroes native of Delaware decreased during the decade from 33,050 in 1900 to 32,664 in 1910; that both the number and the proportion living in other states among natives of Delaware increased during the decade; that the number of

natives of the state living in the state decreased; that, nevertheless, the total native Negro population increased, in consequence of an increase in the number of natives of other states living in Delaware—the proportion of such natives in the total native population of the state having increased from 23.9 per cent in 1900 to 27 per cent in 1910; and that the net loss by interstate migration decreased from 2,479 in 1900 to 1,597 in 1910.

Turning to Table 20, it may be seen where the 9,996 natives of Delaware living in other states were living—in Pennsylvania 5,798, in New Jersey 2,102, in Maryland 840, in New York 463, in Virginia 130, in Massachusetts 122, and in each of 36 other states numbers ranging from 1 to 80. Table 20 shows also, in which states were born the 8,399 Negroes native of other states living in Delaware—in Maryland 5,440, in Virginia 1,206, in Pennsylvania 952, in New Jersey 226, in North Carolina 142, in New York 126, and in 27 other states numbers ranging from 1 to 40.

In Table 21 (p. 80) are given for each state the principal states of residence for natives of the state living in other states, and in Table 22 (p. 83) for each state the principal states of birth for natives of other states. These tables show for each state where natives leaving the state have chiefly gone, and whence natives entering the state have chiefly come. The tables present a rearrangement of totals selected from Tables 17 and 20, pages 71 and 75.

In each of 42 states and in the District of Columbia the number of resident Negroes native of other states increased during the decade 1900–1910. It thus appears that in the case of each of these states immigration of Negroes native of other states was, during the decade, more than sufficient to cover the mortality among immigrants living in the state in 1900, or entering the state during the decade, and also the emigration of natives of other states during the decade.

In the same period for each state and the District of Columbia, with the single exception of Vermont, the number of Negroes native of the state living in other states had increased.

The state showing the highest percentage of its Negro natives resident in other states in 1910 was Nevada. Of the 376 Negroes born in Nevada 332, or 88.3 per cent, were living in other states, only 44 of the 484 native Negro residents of Nevada being natives of the state. The state showing the smallest proportion of its natives living in other states was Florida. Of the 215,110 Negroes native of Florida only 16,614, or 7.7 per cent, were living in other states. Of the 664,823 Negroes born in Texas, 62,062, or 9.3 per cent, were living in other states. Among the Southern states the percentage "living in other states" was relatively high for the northern border states lying east of the Mississippi (Delaware 30.6 per cent, Virginia 28.9, Kentucky 27.9, West Virginia 25.4, Tennessee

NATIVITY.

1 Includes population of Indian Territory for 1910.

24, Maryland 23.2), and relatively low in the states lying farther to the south and west (North Carolina 17.7 per cent, South Carolina 14.2, Alabama 13.5, Mississippi 12.9, Georgia 12.1, Arkansas 11.5, Louisiana 11.5, Oklahoma 10.4, Texas 9.3, and Florida 7.7). In 20 of the 32 Northern and Western states the percentage "living in other states" exceeded the maximum percentage shown for any Southern state (namely, 30.6 for Delaware).

Table 17 shows also the net gain or loss through interstate migration of each state for the two years 1900

and 1910. In 1910 it is shown that the state of Virginia had lost on account of interstate migration of Negroes, 206,764 in population. For this state there were reported as born in the state and living in other states 253,334, and as living in the state and born in other states 46,570, the difference between these numbers being the net loss of the state on account of interstate migration. The corresponding net loss in 1900 was somewhat greater than in 1910, being in 1900 218,430. Generally, it is true of the Northern and Western states that they have gained by interstate

migration, the only exception among these states being in fact Maine, and generally the Southern states have lost, although in the case of six Southern states, three being in the West South Central division, the population has increased on account of interstate migration.

The total number of interstate migrants in 1910, as shown in Table 17 (1,616,808), exceeded the number of interdivisional migrants, as shown in Table 15 (963,153), by 653,455, which was the number of intradivisional migrants among native Negroes, i. e., the number of Negroes who had migrated from their native state and were in 1910 living in some other state in the same geographic division. This total embraces, as is shown by the more detailed classification of Table 20, 91,333 natives of the state of Virginia who were living in other states of the South Atlantic division, since as is shown in Table 20, in the Negro population native of Virginia (numbering in 1910, 876,806) the number living in the South Atlantic division (714,805) exceeded the number living in Virginia (623,472) by 91,333. Similar aggregates may be determined for each other state of this division and of other divisions, the sum of these aggregates giving the total of 653,455, as the number of intradivisional migrants in the native Negro population.

While this intradivisional migration may properly be characterized as being in large part short-distance migration across common boundaries of contiguous states, it undoubtedly embraces cases of migrants who have moved very considerable distances, the areas of the several geographic divisions being in each case sufficient to embrace extensive migratory shiftings of population. It is possible, for example, to travel directly west from the lower Mississippi River for a distance of more than 700 miles without leaving the West South Central division, and undoubtedly there is a considerable Negro migration westward within this division. Some of this movement is indicated in Table 20, which shows that 10,771 natives of Arkansas and 8,498 natives of Louisiana were living in Oklahoma in 1910 and that 6,328 natives of Arkansas and 19,703 natives of Louisiana were living in Texas. It may be noted incidentally that there had been within this division also a considerable Negro migration northward and eastward out of the state of Texas, as is shown by the number of native Texans living in Oklahoma (35,397), Arkansas (5,383), and Louisiana (8,058).

Although the intradivisional shiftings of population embrace migrations for distances amounting in individual cases to hundreds of miles, it will be apparent that migration for a very short distance may in other cases carry the migrant across a divisional or sectional boundary, and bring him into the class of interdivisional or intersectional migrants. Migration from the South into the North may be effected by crossing the Ohio River from Kentucky into Illinois, Indiana,

or Ohio, or by crossing the Mississippi into Missouri, or by simply moving across any common boundary separating a Southern from a Northern state.

On the other hand, a very considerable amount of short-distance migration is intrastate, and is, therefore, not at all in evidence even in Table 20, classifying the population by state of birth and by state of residence. This table can not take account, for example, of the very considerable and persistent migration out of rural districts into urban communities where the rural district and the urban community both lie within the boundaries of a single state.

It should be borne in mind further that the number of interstate migrants as it is figured from the census returns, is determined by the place of residence at the date of the census. A native of Georgia or of any other Southern state who had lived during the greater portion of his life in New York City, but had prior to the census returned to his native state would not be distinguished in the census returns as a migrant.

It will be clear also that a tabulation by state of birth affords no indication of the number of migrants or of migrations in any given period, because the migration revealed by the fact that the person enumerated in the census was living in a different state from that in which he was born may have occurred at any period during his lifetime. It may therefore be a very recent event or it may have occurred many years ago.

Table 18 covering the two years 1910 and 1900 summarizes data for the South, the North, and the West. It shows for the Negro population born in the South the number and proportion living in the state of birth and the number and proportion living in some other state in the South, in the North, and in the West; and for the Negro population living in the South the number and proportion born in the state of residence and the number and proportion born in some other state in the South, in the North, and in the West—corresponding data being shown for the North, and for the West. As regards the population figures of Table 18, the lower half of the table is a rearrangement of the detail of the upper half, although the bases upon which the percentages are figured are different in the two halves of the table. For the Negro population born in and living in the United States the aggregate born in the several sections combined is of course identical with the aggregate living in the several sections combined (9,746,043 in 1910, and 8,786,547 in 1900, which aggregates are distributed twice in Table 18). The slight differences in certain of the percentages of Table 18 from similar percentages shown in Tables 12 and 13 are accounted for by the inclusion in Tables 12 and 13 of Negroes for whom state of birth was not reported and native Negroes born outside the United States.

The distributions of Table 18 indicate a general though not very marked increase in intrasectional

as well as in intersectional migration during the decade 1900-1910. The tendency among Negroes born in the South to migrate from the state of birth to another Southern state, increased slightly, the percentage living in the South outside the state of birth among natives of the South increasing from 11 in 1900 to 11.2 in 1910, and similarly the tendency among Negroes born in the North to migrate to a Northern state, and among Negroes born in the West to migrate to a Western state increased (the percentage change for these natives being from 14.5 to 16 in the North and from 8.2 to 9.5 in the West). The proportion living in the state of birth accordingly decreased among those born in each section (among natives of the South from 84.8 per cent in 1900 to 84 per cent in 1910, among natives of the North from 78.8 to 75.8 and among natives of the West from 70.7 to 60.3). Among natives of the South the proportion living in the North increased from 4.1 to 4.6 per cent, and the proportion living in the West from 0.2 to 0.3.

The small proportion born in the North among Negroes living in the South (0.4 per cent) remained unchanged and among Negroes living in the West decreased (from 27.3 to 24.9 per cent). The proportion born in the West is inconsiderable among Negroes living in the South and in the North.

Reference has already been made to Table 20, in which the Negro population is classified according to division and state in which born and by division or state of residence, this being, as regards 1910, the basic state of birth table for Negroes; to Table 21, which shows for Negroes born in each state the number living in selected states of residence; and to Table 22, which shows the number of natives and of foreign-born Negroes resident in each state, and for the natives the number born in selected states.

INTERSTATE MIGRANTS IN URBAN COMMUNITIES.

Table 19 classifies by nativity for 1910 the Negro and white population of cities of 50,000 or more inhabitants having a Negro population of 5,000 or more, the cities being grouped as northern and western and as southern cities, and arranged in order in each group according to their Negro populations. In this table it is shown that of the 91,709 Negroes living in New York City in 1910, 26,977 were born in the state of New York, and 52,202, or 56.9 per cent, in other states. The 773 "other native" include those born in the United States, state of birth not reported, born in outlying possessions, or at sea under the United States flag, and American citizens born abroad. The number foreign born in the Negro population of New York City was 11,757. Similar data are shown for the white population.

Among Negroes the percentage born in a state other than that in which the city of residence was located was highest for Los Angeles, of whose Negro population 83.4 per cent were born outside of California. The second highest proportion was that for Oklahoma City, 82.6 per cent; the third, that for Jersey City, 71.8 per cent. In 22 of the 41 cities listed in Table 19 the proportion born outside of the state exceeded one-half, the proportion being generally much higher in the northern and western than it was in the southern cities. Exceptions among southern cities were Oklahoma City, Washington, and Jacksonville, each of which showed a high percentage of migrants. In the aggregate population for northern and western cities 60.9 per cent of the Negro as compared with 13.9 per cent for the white population was born outside the state in which the city of residence was located, the proportion being much higher for Negroes than for whites. In the southern cities as a group the proportion "Born outside the state" was much lower for Negroes and higher for whites than in the northern and western cities, the proportion for Negroes of 26.1 per cent being only slightly above that of 24.8 per cent for whites.

Table 18 NEGROES BORN IN AND LIVING IN THE UNITED STATES FOR WHOM STATE OF BIRTH WAS REPORTED.

¹ Cities of 50,000 or more inhabitants, having 5,000 or more Negroes.² Includes persons born in the United States, State of birth not reported; persons born in outlying possessions, at sea under the United States flag, and American citizens born abroad.

In the South and in the North and West, for the aggregate Negro population of the cities, the proportion born outside the state of residence was considerably above the corresponding proportion for the Negro population as a whole in these sections—26.1, as compared with 12.2 per cent in the South, and 60.9 as compared with 53.6 per cent in the North and West.

It should be borne in mind that the proportion born outside the state in the case of any individual city is materially affected by the location of the city. A city located on the boundary of two states may draw population from the neighboring state in much larger proportion than a city located in the interior of the state, remote from the territory of other states.

NATIVITY.

CHAPTER VII.—URBANIZATION—URBAN AND RURAL CLASSIFICATION, AND POPULATION OF CITIES.

POPULATION, URBAN AND RURAL, AND IN CLASSES OF CITIES, BY RACIAL CLASSES: 1910.

In the census tabulations the population living in cities and towns of 2,500 or more inhabitants is classified as urban, and the population living in smaller villages and towns and in open country districts as rural.

Under this classification the urban population, although it is purely urban in the sense that it is entirely a city or town population, does not embrace the entire population gathered into cities, towns, and villages. The rural population, on the other hand, is not purely a scattered population, since it embraces a semi-urban element in the population of many small rural towns and villages. Undoubtedly the conditions obtaining in these small population centers differ materially from those obtaining in the open country. The small village may be primarily commercial or industrial, while the open country is primarily agricultural. It would, however, be exceedingly difficult, if not impossible, to separate accurately this small village population from the population of the open country, since the rural village communities are in many cases unincorporated, and without definitely established boundaries. In such cases the rural village may graduate by imperceptible degrees of population density into the surrounding country with which it is more or less intimately affiliated by economic interests.

Urbanization as defined in the census figures relates, therefore, as has been stated, to an arbitrarily determined population limit. It does not comprehend the growth of the small village population in the rural districts, but only that urban growth which is located in the larger towns and cities.

So defined, the proportions urban and rural, and the changes in these proportions from decade to decade, indicate conditions and tendencies for the several classes of the population which are of social significance.

In Table 1, on the following page, the urban and rural population, and the population of urban communities of specified size in 1910, is given for each racial class.

The proportion urban in 1910 was lowest among Negroes and highest among foreign-born whites, the percentage living in urban communities being 27.4 for Negroes and 72.2 for foreign-born whites. This pro-

portion varies greatly from one white class to another, even among natives. Of native whites of native parentage, 36.1 per cent were in urban communities; of native whites of mixed parentage (one parent native, one foreign born), 59.4 per cent; and of native whites of foreign parentage (both parents foreign born), 68.1 per cent.

A much larger proportion of the white population of foreign birth and parentage than of the Negro, or of the native white population of native parentage, were in the larger cities. Of the foreign-born whites, for example, 29 per cent, and of the native whites of foreign parentage, 25.4 per cent, or more than one-fourth of each class, were in cities of 500,000 or more in 1910, the proportion in such cities for Negroes being 4 per cent and for native whites of native parentage, 6 per cent.

Of the Negroes, 72.6 per cent were living in rural communities, the corresponding proportion for native whites being 55.8 per cent and for foreign-born whites 27.8 per cent.

The several racial classes thus contribute in varying proportions to the urban and rural population aggregates, and it follows necessarily that the racial composition of the urban population differs from that of the rural. Of the total urban population in 1910, 6.3 per cent was Negro, and of the total rural, 14.5 per cent. The urban population was 41.9 per cent native white of native parentage, the rural 64.1 per cent. More than one-half of the urban population and approximately one-fifth of the rural was of foreign birth or of foreign or mixed parentage.

In the aggregate population of cities of 500,000 or more, in which more than 70 per cent of the population was of foreign birth or of foreign or mixed parentage, Negroes constituted only 3.4 per cent. The percentage Negro for classes of cities having less than 500,000 population was higher than for the class of larger cities, and was almost unvarying from one class to another, the range of variation being from 7.1 per cent in cities of 100,000 to 500,000 to 7.7 per cent in cities of 2,500 to 10,000. Geographic location rather than size is of course the determining factor as regards proportion Negro in the population, and the low percentage Negro for the cities of 500,000 and over is explained by the fact that these eight cities are none of them, except Baltimore, located in Southern states.

RACIAL COMPOSITION OF THE URBAN AND RURAL POPULATION: 1910, 1900, 1890.

In Table 2 the urban and rural population and the percentage urban and rural is shown by racial classes for the three years, 1910, 1900, and 1890, together with the percentage distribution of the urban and rural population by racial classes in each of these years.

The percentage urban in the Negro population increased from 19.8 in 1890 to 22.7 in 1900 and to 27.4 in 1910; in the native white population of native parentage the corresponding increase was from 26.2 to 30.9 and to 36.1 per cent.

In each of the classes shown in Table 2 the proportion urban increased during each decade in approximately the same degree, so that only slight changes were effected in the racial composition either of the urban or of the rural population. Although, for example, the percentage urban in the Negro population increased from 19.8 in 1890 to 27.4 in 1910, the percentage Negro in the urban and in the rural population was almost unvarying, being in the urban 6.5 in 1890, 6.5 in 1900, and 6.3 in 1910; and in the rural population, 14.9 in 1890, 15.1 in 1900, and 14.5 in 1910.

Foreign or mixed parentage:							
1910.....	12,346,900	6,550,937	65.3	34.7	29.0	13.3	
1900.....	9,515,191	6,130,826	60.8	39.2	30.9	13.6	
1890.....	6,515,974	4,987,701	66.8	33.2	28.7	12.4	
Foreign born:							
1910.....	9,638,369	3,710,176	72.2	27.8	22.6	7.5	
1900.....	5,822,130	3,991,687	66.8	33.2	22.2	7.2	
1890.....	5,635,422	3,486,445	61.8	38.2	24.8	8.7	

The native white of native parentage, in which the percentage urban increased from 26.2 in 1890 to 36.1 in 1910, constituted 39.7 per cent of the urban population in 1890, 40.2 per cent in 1900, and 41.9 per cent in 1910; the percentage in this class of the total rural population being in these years 63.3, 63.2, and 64.1, respectively.

URBAN AND RURAL INCREASE: 1890-1910.

Three factors may be indicated in the growth of the urban population: (1) The natural increase by excess of births over deaths in urban communities; (2) the increase by net migration to the cities from the country districts; and (3) the growth by extension of urban territory, that is to say, by the growth of rural into urban communities.

Even if population were increasing at the same rate in all communities, both urban and rural, the aggregate urban population would increase faster than the aggregate rural, since in any period a certain number of rural communities would in consequence of the normal population growth become urban, and their total populations would thereby be added to the urban increase and subtracted from the rural. The rates of growth characteristic of urban and rural communities are, therefore, not accurately represented by the rates of growth of the urban and rural population aggregates, since the increases for these aggregates do not, in fact, relate to a specific group of urban communities on the one hand, or on the other to a specific rural area. The increase of the urban population by the growth of rural into urban communities is, however, relatively small as compared with the total urban increase in any decade. Increases figured upon the populations of Table 2 may, therefore, be regarded as indicating approximately the rates of urban and rural population growth in the two decades 1890-1900 and 1900-1910. Such increases are presented in Table 3.

The urban Negro population in 1910 exceeded the urban Negro population in 1900 by 683,257, or 34.1 per cent, and the rural Negro in 1910 exceeded the rural Negro in 1900 by 310,512, or 4.5 per cent. The corresponding percentage increases for the preceding decade were 35.4 for the urban and 13.6 for the rural population. In each class of the population the percentage increase of the urban aggregate greatly exceeded that of the rural aggregate. In the Thirteenth Census report the increase of the total population in the area classified as urban in 1910 and in the area classified as rural in 1910 was figured, but not by racial classes. The population increase in the 1910 urban territory was 34.8 per cent and in the 1910 rural territory 11.2 per cent. The differences between these percentages and the percentages shown in Table 3 for the total population—i. e., the difference between 34.8 and 38.4 per cent for the urban and between 11.2 and 9.2 for the rural—are accounted for by the net growth of rural into urban communities during the decade 1900-1910. The percentages for Negro increase were undoubtedly similarly affected, and a calculation similar to that made for the total population, if it could have been made for the Negro element, would undoubtedly have shown a Negro increase for territory classified as urban in 1910 somewhat below 34.1 per cent and an increase for territory classified as rural in 1910 somewhat above 4.5 per cent. The difference between the rate of growth of the urban and of the rural element would thus have been somewhat less than the difference indicated by the percentages of Table 3.

SECTIONS AND SOUTHERN DIVISIONS.

The number and percentage urban and rural in the Negro and white population classes in 1910 is given in Table 4 for sections and southern divisions.

The percentage urban for the Negro population in the North and West greatly exceeded the corresponding percentage for that population class in the South. The Negro population in the North was 77.4 per cent urban; in the West, 78.6; and in the South, 21.2. Conversely, 78.8 per cent of the Negro population in the South was rural, the percentage rural for the North being 22.6, and for the West, 21.4. It is clear from these figures that the Negro migration to the North and West has been largely to urban centers, since more than three-fourths of this class in the North are in such centers, while in the South more than three-fourths are in rural communities.

In the South the percentage urban was somewhat higher, although the difference is not considerable, for Negroes than for native whites of native parentage—21.2 as compared with 19.8 per cent—but was very much lower for Negroes than for whites of foreign birth or parentage. In the North and West, however, the Negro percentage urban exceeded that for any other racial class in these sections, even that for the foreign-

NEGRO POPULATION.

born whites, who are largely concentrated in urban centers, the percentage urban for Negroes in the North being 77.4, and for foreign-born whites 75.5. While,

therefore, in the South the Negro population is largely rural in character, in the North this class is the most urban of the racial classes.

DIAGRAM I.—PERCENTAGE URBAN AND RURAL IN THE NEGRO AND WHITE POPULATION, BY SECTIONS: 1910.

Since, however, the great mass of the Negro population is in the South, the extremely high percentage urban applies to a relatively small proportion of this racial class.

In Table 5 the percentage urban and rural in the Negro population of the South and North is shown for the years 1910, 1900, and 1890. In each section and division the proportion of the Negro population living in urban communities increased during each of the two decades covered by the table. In the South the increase was from 15.3 per cent in 1890, to 17.2 per cent in 1900, and 21.2 per cent in 1910; in the North from 61.8 per cent in 1890, to 70.5 per cent in 1900, and to 77.4 per cent in 1910; and in the West from 54 per

cent in 1890 to 67.4 per cent in 1900, and to 78.6 per cent in 1910. Corresponding decreases are shown for the proportion living in rural communities in each section and division. These proportions for sections are illustrated in Diagram II.

Table 5	NEGRO POPULATION.					
	SECTION AND DIVISION.					
	Percentage urban.			Percentage rural.		
	1910	1900	1890	1910	1900	1890
United States.....	27.4	22.7	19.8	72.6	77.3	80.2
The South.....	21.2	17.2	15.3	78.8	82.8	84.7
South Atlantic.....	21.1	18.7	17.4	77.9	81.3	82.6
East South Central.....	19.2	15.5	12.9	80.8	84.5	87.1
West South Central.....	22.0	16.7	14.0	78.0	83.3	86.0
The North.....	77.4	70.5	61.8	22.6	29.5	38.2
The West.....	78.6	67.4	54.0	21.4	32.6	46.0

The geographic distribution of the urban and rural Negro and white population in 1910 is shown in Table 6. Of the Negro urban, 69 per cent was in the South; of the native white urban, 14.5 per cent; and of the foreign-born white urban, 4 per cent. Of the rural Negro population, 96.6 per cent was in the South; of the rural native white, 40.4 per cent; and of the rural foreign-born white, 9.2 per cent. Only 3.4 per cent of the rural Negro population was in the North and West.

URBANIZATION.

DIAGRAM II.—PERCENTAGE URBAN AND RURAL IN THE NEGRO POPULATION, BY SECTIONS: 1910, 1900, and 1890.

The percentage Negro in the urban and rural population of the North and South is given in Table 7 for 1910, 1900, and 1890.

Table 7 PERCENTAGE NEGRO IN THE POPULATION.

SECTION AND DIVISION.	PERCENTAGE NEGRO IN THE POPULATION.					
	Urban.			Rural.		
	1910	1900	1890	1910	1900	1890
United States.....	6.3	6.5	6.5	14.5	15.1	14.9
The South.....	28.0	30.9	31.7	30.3	32.6	34.2
South Atlantic.....	29.4	31.2	32.8	35.2	36.9	37.8
East South Central.....	32.3	34.2	33.5	31.4	32.9	32.9
West South Central.....	22.3	26.7	26.9	22.7	25.8	29.4
The North.....	2.4	2.5	2.4	1.0	1.1	1.1
The West.....	1.0	1.2	1.3	0.3	0.4	0.6

Of the urban population in 1910, 28 per cent was Negro in the South; 2.4 per cent in the North; and 1 per cent in the West. Of the rural population, 30.3

per cent was Negro in the South; 1 per cent, in the North; and 0.3 per cent, in the West. In the South as a whole, the percentage Negro in the urban population decreased from 31.7 per cent in 1890, to 30.9 in 1900, and to 28 in 1910; and in the rural population from 34.2 per cent in 1890, to 32.6 in 1900, and to 30.3 in 1910.

THE STATES.

Table 8 gives the Negro and white urban and rural population in 1910 and the percentage urban in the Negro and white population, by states.

NEGRO POPULATION.

Table 9 relates to the Negro population alone, giving by states the urban and rural Negro population, the percentage urban and rural in the Negro popula-

tion, and the percentage Negro in the urban and rural population, for the three years, 1910, 1900, and 1890.

NEGROES IN URBAN AND RURAL COMMUNITIES, BY DIVISIONS AND STATES: 1910, 1900, AND 1890.

[Urban includes population living in places of 2,500 or more inhabitants; rural includes all other.]

Excepting Massachusetts, Rhode Island, and New Jersey, the percentage urban in each Northern and Western state was higher in 1910 among Negroes than among whites. In these states the percentage urban in the Negro population ranged from 46.6 per cent in Wyoming to 95 per cent in Rhode Island. In the Southern states the proportion ranged from 9.4 per cent in Mississippi to 42.7 per cent in Maryland.

The highest percentage Negro in both the urban and the rural population in 1910 was that of Mississippi, in which state 46 per cent of the urban and 57.5 of the rural population were Negroes. Consistently with changes in the proportion Negro in the total population, the proportion Negro in the urban and in the rural population tended to decline in the Southern states, in the two decades 1890-1910, although in some instances the proportion increased.

URBAN COMMUNITIES.

Table 10 gives the Negro population in 1910 and in 1900, and the Negro increase 1900-1910, for the 43 cities having in 1910 a Negro population of 10,000 or more, the cities being arranged in order according to the 1910 Negro population. Ten of these cities lie outside the Southern states. The total Negro population of the 43 cities in 1910 was 1,341,468, or 13.6 per cent of the Negro population of the United States.

1 A minus sign (-) denotes decrease.

The city of Washington reported the largest Negro population of any city in 1910, and New York City the second largest. Birmingham, Ala., reported the largest increase during the decade 1900-1910, 35,730, or 215.6 per cent, and New York City, the second largest increase, 31,043, or 51.2 per cent. The Negro population of Fort Worth, Tex., increased 212.5 per cent; of Jackson, Miss., 137.3 per cent, and of Portsmouth, Va., 106.5 per cent. Charleston, S. C., Augusta, Ga., and Little Rock, Ark., showed slight decreases.

In Table 11 the Negro and white population of the 50 cities given in 1910 a population of 100,000 or more is here, together with the percentage Negro and the percentage foreign-born white. The cities are arranged in order according to the percentage foreign-born white. The aggregate population of these 50 cities was 20,302,138, of which 1,023,561, or 5 per cent, were Negroes and 5,815,176, or 25 per cent, were foreign-born whites. The 5 cities in this group in which the percentage foreign-born white was lowest were Nashville, Atlanta, Richmond, Birmingham, and Memphis.

¹ Includes Indians, Chinese, Japanese, and other colored.

NEGRO POPULATION.

These were also the 5 cities having the highest percentage Negro in the population. In these cities the percentages were, for foreign-born whites, 2.7, 2.8, 3.2, 4.3, and 4.9; and for Negroes, 33.1, 33.5, 36.6, 39.4, and 40. The 5 cities in which the percentage foreign-born white was highest were Boston, Paterson, New York, Lowell, and Fall River, the percentages for this class being 35.9, 36.1, 40.4, 40.9, and 42.6; and for Negroes, 2, 1.2, 1.9, 0.1, and 0.3. The conditions obtaining in the cities generally reflect those obtaining in the states in which the cities are located, the percentage foreign-born white being generally low in the South, and high in the North in the cities as in the states.

The Negro population for the two years 1910 and 1900, in cities of 100,000 or more, is represented by Diagram III on this page, cities having a Negro population of less than 1,000 being omitted.

Table 12 gives the Negro population in 1910 and 1900 of all urban communities—that is to say, of all cities, towns, and villages having in 1910 a population of 2,500 or more.

WARDS OF CITIES.

The Negro population in 1910, and the percentage Negro in the population, is given in Table 13, for wards or equivalent subdivisions, of each city having, in 1910, a total population of at least 50,000 and a Negro population of at least 5,000. While the range of variation from ward to ward in the percentage Negro is very considerable in the cities shown in Table 13, it is nevertheless true of the southern cities that the Negro population is generally distributed throughout these urban communities, constituting in the case of each city a considerable element in the population of the several wards.

CHARACTERISTICS OF URBAN COMMUNITIES.

Statistics for urban communities, showing for the Negro population number of males 21 years of age and over, number of illiterates in the population

10 years of age and over, and number attending school in the population 6 to 14 years of age, are given in General Table I. Statistics of sex and age composition, marital condition, school attendance, illiteracy, nativity (state of birth), and color (black and mulatto), are given for urban communities, in sections of the chapters dealing with these characteristics.

DIAGRAM III.—NEGRO POPULATION IN CITIES HAVING 100,000 POPULATION OR MORE AND A NEGRO POPULATION OF MORE THAN 1,000: 1910 AND 1890.

NEGRO POPULATION.

CHAPTER VIII.—THE “BLACK BELT”—NUMBER, INCREASE, AND DENSITY, BY COUNTY AREAS.

THE COUNTY AS A UNIT AREA OF COMPILATION.

The county areas, which are the units of compilation in the present chapter, embrace, as subdivisions of the states, in the aggregate, the entire area of the states, including urban communities as well as country districts.

The population of a county may be largely or entirely urban, or, on the other hand, largely or entirely rural in character. It may be primarily industrial or commercial, or primarily agricultural; and the character of its industry, commerce or agriculture, may differ materially from that of other counties in the same state, or in other states. Generally it is true of the county population, as of the state population, that it is partly urban and partly rural, partly industrial or commercial, and partly agricultural.

These characteristics affect variously the number and increase of county populations. A county, for example, in which a large city is located, may be attracting population from neighboring counties and may show in consequence a rapid increase in population, while the populations of the neighboring counties themselves are, on the other hand, reduced, or at least prevented from increasing normally. Within any given county all of the increase may be localized in one or two urban communities, while in an adjoining county the increase may be distributed throughout the entire area.

As regards the diversity of their characteristics the counties resemble in miniature the states. The areas of certain counties, however, exceed the areas of some states, and there are a number of urban counties of comparatively small area, each of whose populations exceed the population of several states combined. Besides the state of New York, for example, there were in 1910 only seven states which reported populations greater than that reported by the single county of New York, whose population in fact exceeded the combined population of the eight states constituting the Mountain division, and there were in New York state alone 20 other counties whose populations severally exceeded that of the state of Nevada.

Compilations which deal with county aggregates of population do not distinguish the urban from the rural elements, but they do determine by relatively small areas the geographic distribution of the population within the several states. As regards the

Negro population, this distribution, taken in conjunction with the corresponding distribution of the white population, is a fact of considerable interest, especially when conditions obtaining in one census year are compared with those obtaining in a subsequent year, to determine to what extent, if at all, the Negro population is massing in certain areas, and is diffusing itself throughout other areas.

By a composition of county areas, independently of state boundaries, it is possible to determine for the Negro population, the areas of high density, and those of rapid or slow increase or decrease. These composed areas are defined in the following tables, and are developed graphically upon several maps.

CLASSIFICATION OF COUNTIES BY NEGRO POPULATION: 1910.

The aggregate number of counties in the United States in 1910 was 2,953, of which 1,351 were in the South, 1,265 in the North, and 337 in the West.

Negro population was reported from 2,843 of these counties, the number reporting no Negro population being 110, of which 32 were in the South and 78 in the North and West. Of the 32 southern counties which reported no Negro population, 28 were in Texas, 2 in Oklahoma, 1 in Arkansas, and 1 in North Carolina. Outside of Texas, therefore, there were in the South only 4 counties which reported no Negro population in 1910. The average Negro population per county in the South was 6,476, and the average white population 15,209; the corresponding averages for the North were 812 Negroes and 43,194 whites, and for the West 150 Negroes and 19,419 whites. There was, however, in every section of the country a wide range of variation in the Negro population of counties, as is shown in Table 1, in which the counties are classified with reference to their Negro population in 1910.

The District of Columbia is classified in Table 1 and in other county tables as a county, and its Negro population of 94,446 exceeded that of any other county. Shelby County, Tenn., in which is located the city of Memphis, reported the second largest Negro population, 91,719, and Jefferson County, Ala., which includes Birmingham city, the third largest, 90,617. Of the 2,843 counties reporting Negroes in 1910, 1,088 reported in each case fewer than 100.

The Negro population in 1910 of the 2,843 counties reporting Negroes, is given in General Table III

which presents, by counties, general statistics relating to number, color, sex, males 21 years of age and over, illiteracy, and school attendance, for the Negro population of all states, Northern and Western as well as Southern.

It will be apparent from Table 1 that the Negro populations (as well as the total populations) of many counties exceeded the Negro populations of a number of states. There were, for example, 53 counties which reported Negro populations in excess of

25,000, and 23 states whose Negro populations were less than 25,000. The aggregate Negro population of these 53 counties was 2,203,951, or nearly one-fourth of the total Negro population of the country. They reported a population greater than the aggregate Negro population of the 32 Northern and Western states, combined with that of 6 Southern states—Florida, Kentucky, Maryland, Oklahoma, West Virginia, and Delaware—and the District of Columbia.

COUNTIES CLASSIFIED ACCORDING TO NEGRO POPULATION, BY SECTIONS AND SOUTHERN DIVISIONS: 1910.

SECTION AND DIVISION.	NUMBER OF COUNTIES: 1910.													
	Total.	Report- ing no Negro popula- tion.	Reporting Negro population—											
			Total.	Under 1,000.			Total.	1,000 or more.						
				Total.	Under 100.	100 to 500.		500 to 1,000.	Total.	1,000 to 5,000.	5,000 to 10,000.	10,000 to 25,000.	25,000 to 50,000.	50,000 to 75,000.
United States.....	2,953	110	2,843	1,735	1,088	446	201	1,108	494	302	259	43	4	6

West South Central.....	456	31	425	196	112	48	36	229	89	74	59	6		1
The North.....	1,265	62	1,203	1,033	684	260	89	170	131	23	11	3	1	1
The West.....	337	16	321	311	252	53	6	10	8	2				

Of the 1,602 northern and western counties, only 180 reported Negro populations of 1,000 or more, the Negro population in the case of 936 of these counties being less than 100.

Statistics for individual southern counties, showing the Negro population in each of the four years, 1910, 1900, 1890, and 1880; the decennial increase in each of the three decades 1880-1910; the percentage Negro, at each of the four censuses noted; the number of Negroes to 1,000 whites in the population, in 1910; the area of the county; and the Negro population per square mile in 1910—will be found in General Table II. The statistics given in the following sections of this chapter relate generally to county areas and populations grouped with reference to the number and increase of the Negro population as shown in this county table.

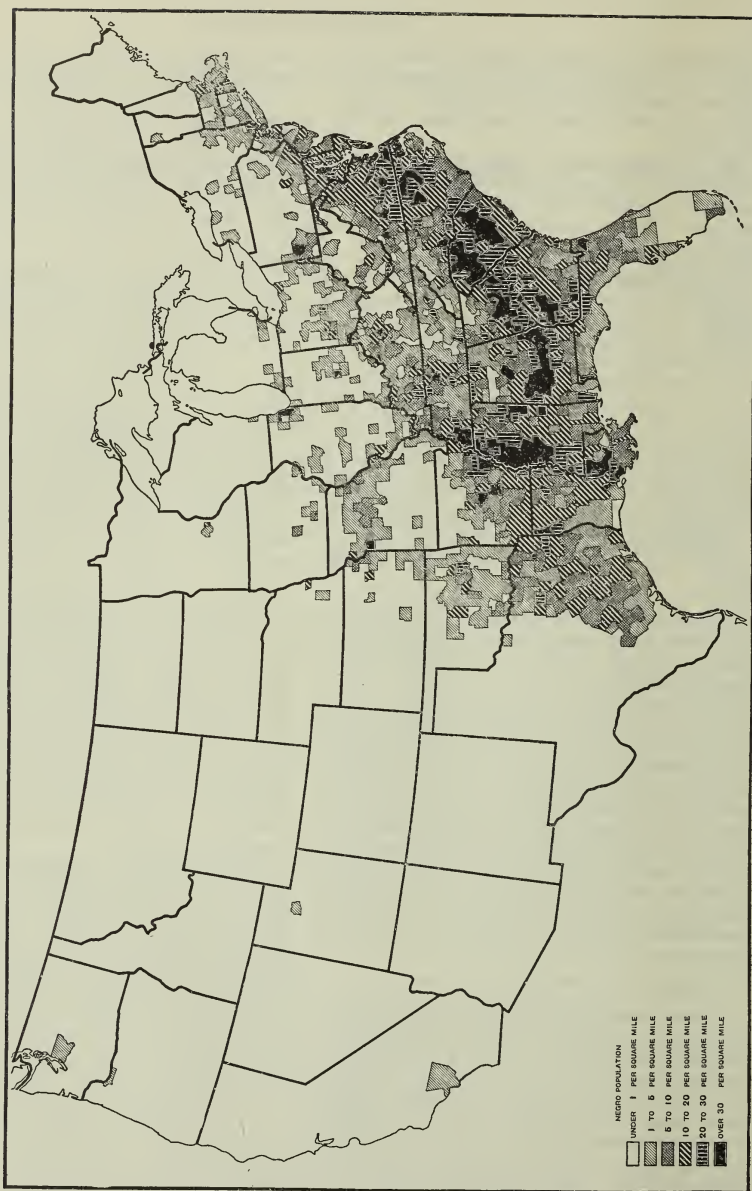

AREA OF RELATIVELY HIGH DENSITY: 1910.

A glance at accompanying Map I will reveal an area of relatively high density of Negro population, extending south from New York City along the Atlantic seaboard, broadening to the southward, through portions of New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, and South Carolina, and continuing westward from South Carolina through central Georgia, Alabama, and Mississippi to the Mississippi River, where it expands north along the Mississippi River, into southwestern Tennessee, and south into Louisiana.

Even within this belt, however, the Negro population does not in itself constitute a population of high density; nor is the region generally one of high density of total population, Negro and white, as compared with the density of population in some other sections of the country. In portions of the belt which have been indicated the density of the Negro population, figured by counties, ranges as low as 10 and even 5 or less per square mile. The area in which it exceeds on the average 30 per square mile is not, as compared with the total area, very extensive, and is much broken into by areas of lower density.

The average density of population of all classes for the country as a whole in 1910 was 30.9 persons per square mile; for New England, where the population was practically all of it white, it was 105.7, and for the Middle Atlantic states, 193.2. It rose to 418.8 in Massachusetts, and to 508.5 in Rhode Island; and exceeded 100 in eight other states, only two of which were Southern. In the Middle Atlantic states the average density of the rural white population was 55; in the East North Central division, 34.8; in the South Atlantic, 21.9; and in the East South Central, 26.1. In these divisions and states there were of course county areas in which the white population per square mile greatly exceeded the average for the division or state as a whole. In the case of the Negro population the average density for the total Negro population was 15.3 in the South Atlantic division, and 14.8 in the East South Central division. The average density for

MAP I.—NEGRO POPULATION OF THE UNITED STATES, PER SQUARE MILE, BY COUNTIES: 1910.

the rural Negro population in each of these divisions was 11.9. In a number of counties which were almost entirely rural, however, as shown by the map, the density of the Negro population exceeded 30. By comparison with general averages for the white population in certain sections of the country the Negro densities appear relatively low, even in the area of maximum Negro population per square mile.

The belt of maximum Negro density of population, it will be noted, lies in the central portions of South Carolina, Georgia, Alabama, and Mississippi; somewhat removed from the Atlantic and Gulf coasts. As compared with this central region, the density of the Negro population in the coast counties, and in the region lying to the north between the Appalachian Mountains and the Ohio River—embracing the states of West Virginia, Kentucky, and Tennessee; the northern portions of Alabama and Georgia; and the western portions of North Carolina, and Virginia—are regions of relatively low density of Negro population.

AREA OF INCREASING, DECREASING, AND STATIONARY NEGRO POPULATION: 1900-1910.

The number of counties in which the Negro population increased, decreased, or remained unchanged during the decade, and the number reporting no Negro population either in 1900 or in 1910, is shown in Table 2. In this table, however, and in other tables where increases or decreases of population are figured by county areas, it has been necessary, on account of changes in county boundaries, to make in certain cases combinations of two or more counties in order to get population figures for identical areas in 1910 and in 1900. These combinations account for the difference between the number of areas for which increases or decreases have been found, and the total number of counties in 1910. The number of counties (2,953) exceeded the number of county areas for which increases or decreases were found (2,751) by 202, which is the reduction in the number of areas resulting from combinations of counties.

It should be noted that the state of Oklahoma, in which there were 76 counties in 1910, is treated as one area, since changes in county boundaries in this state were so general during the decade that accurate comparisons by county areas of 1910 with 1900 were impossible. Except for these combinations, increases and decreases have been figured for single county areas, as defined in 1910.

The Negro population increased during the decade 1900-1910 in 1,433 county or combination-county areas, decreased in 1,229 areas, and remained unchanged in 44 areas, there being 45 areas which reported no Negro population either at the beginning or at the end of the decade. As has been noted in the preceding section, the Negro population of many northern and western counties was very small, and

it is chiefly among such counties that cases of no change in Negro population, or of inconsiderable changes are found. In general, however, it will be apparent that there was in each section of the country a very considerable area in which the Negro population, classified by counties, decreased during this decade.

Table 2

SECTION OR DIVISION.	Number of counties, 1910.	NUMBER OF COUNTIES OR COMBINATIONS OF COUNTIES. ¹				
		Total.	In which the Negro population—			Having no Negro population in 1910 or in 1900.
			In-creased, 1900-1910.	De-creased, 1900-1910.	Did not change, 1900-1910.	
United States.....	2,953	2,751	1,433	1,229	44	45
The South.....	1,351	1,214	662	553	4	15
South Atlantic.....	534	491	298	192	1
East South Central.....	361	347	138	208	1

The North.....	1,285	1,236	582	603	29	22
The West.....	337	301	189	93	11	8

¹ In cases where boundaries of counties were changed during the decade 1900-1910, county areas and populations have been combined and computations made for the combined area. The entire state of Oklahoma is classified as a single area. See text.

It is equally true of the total population of the country, all classes combined, that it decreased during the decade 1900-1910 in a large number of counties, including counties in those sections in which the total population is almost entirely white. According to the Thirteenth Census, for example, the total population decreased in 769 out of 2,841 county or combination-county areas.¹ The decreasing counties embraced in the aggregate 472,462 square miles, or approximately one-sixth of the total land area of the country. Of this decreasing area, 338,334 square miles was in the North and West, and 134,128 square miles was in the South, the area of decreasing population in the South constituting 15.3 per cent of the total area, or approximately one-sixth in the South as in the country as a whole. In the South Atlantic division the decreasing area amounted to 36,830 square miles, or 13.7 per cent of the total area of the division; in the East South Central, to 45,339 square miles, or 25.3 per cent; and in the West South Central, to 51,959, or 12.1 per cent. Even in the West, in which section the population increase amounted to 66.8 per cent, the area of counties in which population decreased amounted to 59,379 square miles. In the northern divisions the decreasing area amounted to from 19.2 per cent, or nearly one-fifth, in New England 37.6 per cent; or nearly two-fifths, in the East North Central division.

¹ The number of counties or combinations of counties considered in the Thirteenth Census report exceeds somewhat the number used in this report. The discrepancies are in the Southern states, and are chiefly accounted for by the fact that in the Thirteenth Census report comparison for Oklahoma counties is based upon the census of 1907, whereas in this report comparison for Oklahoma as for other states is with 1900, the state being treated as one area, owing to the general rearrangement of county boundaries. In several other Southern states a few additional combinations have been made in the present report.

NEGRO POPULATION.

Areas of decreasing population were defined in 1910 in 43 of the 48 states. It will be clear from these figures that population decreases over considerable areas are not peculiar to any one class of population.

In Table 3 the number, area, and Negro population of southern counties or combinations of counties are classified in detail with reference to specific percentages of Negro increase or decrease during the decade 1900-1910. The purpose of these classifications is to determine for the South as a whole the area of

rapid, of average, and of slow increase; of relatively stationary population, and of slow, and of relatively rapid decrease. These areas are represented also by hachures on Map II. Counties or combinations of counties having a Negro population of less than 100 at each census are not classified in Table 3 according to percentage increase. There were 143 such county units, with an aggregate area of 136,973 square miles, or 15.6 per cent of the total area of the South.

COUNTY AREAS AND NEGRO POPULATIONS CLASSIFIED ACCORDING TO RATES OF NEGRO INCREASE OR DECREASE, FOR SOUTHERN STATES: 1900-1910.

¹ See note to Table 2.

² A minus sign (-) denotes decrease.

³ Less than one-tenth of 1 per cent.

Considering counties having a Negro population in 1910 or in 1900, of at least 100, the Negro population decreased during the decade 1900-1910 in 468 southern counties or combinations of counties, aggregating 248,295 square miles in area. This decreasing area amounted to 28.3 per cent, or more than one-fourth of the total area of the South. As may be seen by reference to the map, this area of decreasing Negro population embraces a very large proportion of the region lying between the Appalachian Mountains and the Ohio River, and specifically of four southern states, namely, Maryland, Virginia, Kentucky, and Tennessee. The areas of the 603 county units in which the Negro population increased aggregated 493,058 square miles, or 56.1 per cent of the total area of the South.

In the decreasing area the Negro population fell off from 2,484,881 in 1900, to 2,254,786 in 1910, the decrease amounting to 230,095, or 9.3 per cent. In 1900, 31.4 per cent, and in 1910, 25.8 per cent of the total Negro population of the South lived in this area.

The increase of the increasing counties aggregated 1,056,638, or 19.4 per cent.

The Negro increase of 10.4 per cent in the South as a whole may be taken as representing the natural increase of this class in the South, less a certain number to cover the effect upon population in 1910, of net migration during the decade to the North and West. Making due allowance for variation in the rate of natural increase from county to county, it may fairly be assumed that, in general, counties in which the Negro population increased at a rate above 10.4 per cent, increased in part by a net immigration of Negroes from other counties; and that counties in which the Negro increase was less than 10.4 per cent and those in which the Negro population decreased, lost population during the decade by net emigration to other counties—not necessarily, of course, to other southern counties. The area described in Table 3 as the "area increasing more than the average" may, therefore, be fairly characterized as being the area gaining by a migratory assembling or concentration of Negro pop-

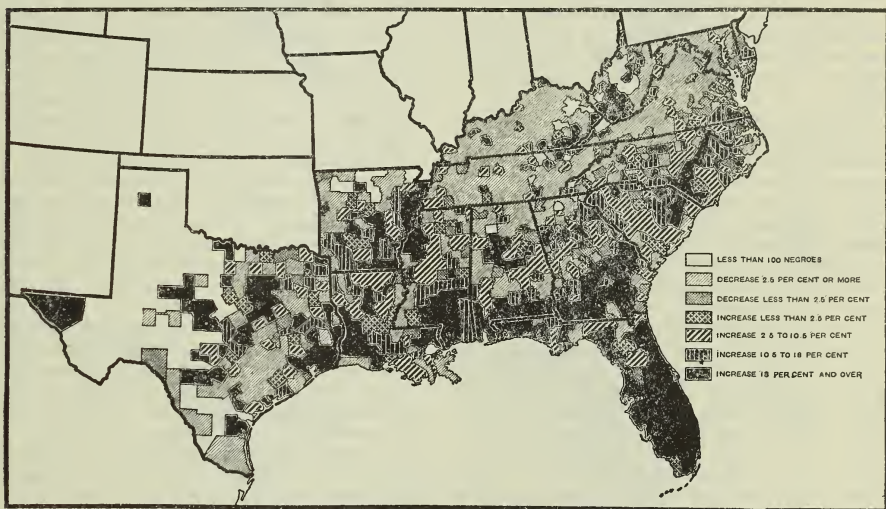

ulation within the South, and the area described as the "area increasing less than the average, or decreasing," as the area losing by net emigration to other counties in the South or to other sections of the country.

Counties in which the Negro population increased at a rate above the average for the southern Negro population as a whole, aggregated 356,408 square miles, or 40.6 per cent of the total area of the South.

Within this area the Negro population increased by 921,316, or 31.1 per cent. The Negro increase in these counties, constituting approximately two-fifths of the total area of the South, thus exceeded the total Negro increase in the South as a whole by 94,858, which is the net decrease of the Negro population in the "area increasing less than the average, or decreasing."

MAP II.—PERCENTAGE INCREASE OR DECREASE OF THE NEGRO POPULATION, BY COUNTY AREAS FOR SOUTHERN STATES (EXCLUSIVE OF OKLAHOMA) 1910-1900.

(Counties reporting less than 100 Negroes at each Census 1910 and 1900 in white.)

In Table 3 an "area of approximately average increase (8 to 13 per cent)" is shown in comparison with the area of "relatively rapid increase (13 per cent or more)," and the "area of low increase (less than 8 per cent) or decrease." The area of relatively rapid increase amounted to 335,847 square miles, or 38.2 per cent of the total area of the South. In this area the Negro increase amounted to 884,388, or 33.5 per cent. In the area of low increase or of decrease, aggregating 355,895 square miles, or 40.5 per cent of the total area, the net decrease of population amounted to 149,144, or 3.4 per cent. The area of "approximately average increase" amounted to 49,611 square miles, and in this area population increased by 91,299 or 9.8 per cent. The area of approximately average increase thus constituted a comparatively small portion (5.6 per cent) of the total area.

Counties in which the Negro increase amounted to 18 per cent or more aggregated 287,685 square miles, or nearly one-third—32.8 per cent—of the total area of the South; and counties in which the decrease amounted to 7.5 per cent or more aggregated 156,237 square miles, or 17.8 per cent of the total area.

Data similar to those given in Table 3 for the South as a whole, are given in Table 4 for each southern division, and southern state.

The Negro population decreased during the decade 1900-1910 in counties aggregating in the South Atlantic division 29.2 per cent of the total area of the division; in the East South Central division, 49.6 per cent; and in the West South Central division, 18.8 per cent.

In Delaware the decreasing area amounted to 53.5 per cent or more than one-half of the total area of the

state; in Virginia to 67.6 per cent or more than two-thirds of the total area of the state; in Kentucky, and in Tennessee to 74.2 per cent or nearly three-fourths of the total area in each case; and in Maryland to 81.2 per cent, or more than four-fifths of the total area.

In every Southern state for which county increases are shown in Table 4, except Delaware, there were counties in which the decrease of the Negro population during the decade amounted to 7.5 per cent or more. In Arkansas the area of such counties constituted 20.9 per cent of the total area of the state; in West Virginia, 25.9 per cent; in Virginia, 42.4 per cent; in Tennessee, 53.1 per cent; in Maryland, 60.6 per cent; and in Kentucky, 62.2 per cent. These are northern border states or states adjoining border states.

The area in which the Negro population remained practically stationary, neither increasing nor decreasing by more than 2.5 per cent, constituted 10.9 per cent of the total area in the South Atlantic division, 7.2 per cent in the East South Central division, and 5.5 per cent in the West South Central. In the states, the lowest percentage for the area of stationary population is that of 2.2 for Kentucky; the highest, that of 31.4 per cent for Delaware, which is very much above that for any other state.

It will be apparent upon an examination of the figures for the states and of the increase map that in every state for which data are presented there are areas in which the Negro population increased rapidly, other areas in which it increased slowly, and still others in which it remained stationary or decreased. In no state was the increase per cent during the decade 1900-1910 approximately an average increase—i. e., within 2.5 of the increase per cent of the Negro population in the South as a whole—over more than 14.9 per cent of the total area of the state. In the South as a whole this area of average increase amounted, as has been noted, to only 5.6 per cent of the total area of the South. The increase throughout 94.4 per cent of the area of the South was either distinctly above or distinctly below the average of 10.4, being either above 13 or below 8 per cent. These

variations are, of course, too considerable to be covered by variations in the rates of natural increase from county to county. They indicate clearly a migratory shifting of the Negro population during the decade, within the Southern states and across state borders, as characteristic of Negro population growth generally throughout the South.

A comparison of the density and increase maps will reveal the fact that the area of rapid increase during the decade 1900-1910 does not generally correspond with the area of maximum density of Negro population. The area of most rapid Negro increase in this period embraces the greater part of Florida, and the southern counties of Georgia, Alabama, and Mississippi, together with counties scattered in other sections of the South. In general, it is true that a wide belt of area in which Negro increase has been rapid encircles the Gulf from southern Florida to the Mississippi River. This lies south of the region of maximum density of Negro population in 1910. A number of counties in the black-belt area, in fact, decreased in Negro population or increased at a low rate during the decade, while counties of relatively low density along the Gulf coast showed generally high rates of increase. Throughout the greater portion of the region of relatively low density lying between the Appalachian Mountains and the Ohio River, on the other hand, the Negro population decreased during the decade. Considering the region east of the Mississippi River, the area of rapid increase lies to the south, and the area of decrease to the north of the area of maximum density, the increase within the "black belt" being generally below the average for the South.

The decrease over large portions of Maryland, Virginia, West Virginia, Kentucky, and Tennessee is undoubtedly accounted for in part by migration into northern states, but the population changes for the decade in the South as a whole indicate for the Negro population of this section a decided drift southward. Considerable areas of rapid increase are scattered, also, in the region to the west of the lower Mississippi, in Louisiana, Texas, and Arkansas, indicating a net Negro migration westward across the Mississippi during the decade.

PROPORTION NEGRO IN THE POPULATION, BY COUNTIES.

It will be clear from the data presented in preceding sections, that the Negro population, although it is largely massed in the South, is nevertheless widely distributed throughout every section of the country, and that within the South it is so distributed that there are areas of relatively dense, and other areas, much more extensive, of relatively sparse Negro population. It has been shown, also, that in certain regions the Negro population has been increasing rapidly, in other regions slowly, and that in still other regions of great extent in the South, it has been decreasing. The various rates of growth and decrease in the different areas have necessarily modified the geographic distribution of the Negro population in recent decades, and seem to indicate, as has been noted, for the decade 1900-1910, a general drift southward from the central area of greatest density, and depletion of the Negro population over an extensive area lying between the Appalachian Mountains and the Ohio River.

Of the white population, also, as well as of the Negro, it is true that over extensive areas it has increased rapidly, increased slowly, and decreased, and that its geographic distribution has been modified by its various rates of growth and decrease in different areas.

The racial composition of the population resident in these areas has necessarily been affected in varying degrees, by the changes in the geographic distribution of the Negro and white elements in the population which have taken place in recent decades. These changes have been largely in response to local or sectional economic developments, which have induced migratory shiftings of population more or less selective as regards racial elements, within the South and in the country as a whole.

The more rapid increase of the white, as compared with the Negro element, by natural growth and by immigration, during this period has tended to lower the proportion Negro in the population generally throughout the country, but this general decline has been obscured by local variations. In the South the proportion Negro in the population declined from 32.3 per cent in 1900 to 29.8 per cent in 1910, and if the population increase, Negro and white, during the decade had been distributed proportionally to the population of each class, the proportion Negro in the population of each southern community would have shown a decline.

While, however, the proportion Negro has in fact declined over considerable areas in the South, it has coincidentally increased over other areas of large extent. Diverse influences have affected the increase of the Negro and white elements in varying degrees locally, and it would be exceedingly difficult to determine by any statistical analysis the single effect of any one tendency, such as, for example, the tendency toward racial agglomeration or segregation, on the one hand,

or on the other hand toward more even diffusion of racial elements. It would not be difficult to devise an index of segregation, and by the employment of such an index to arrive at a statistical conclusion that the Negro and white elements were in some definite degree more or less separated from one another in 1910 than they were in 1900, that these elements had in the aggregate in some degree either drawn apart, or become more evenly diffused with reference to one another during the decade. An accurate statistical measurement of the relative dispersion of the Negro and white elements, would undoubtedly demonstrate that relatively to one another the geographic distribution of these elements had changed during the decade, but such a change might be due to accidental causes, quite independent of any tendency of the population to segregate along racial lines, or of the racial elements in the population to diffuse, and it is certain that any index of segregation would yield very different results, according as it was applied to the population growth and distribution in different sections of the country. The aggregate tendency represented by any statistical summarization would not be a tendency prevailing generally throughout the country, but would be merely an artificial resultant of very uncertain significance.

If the racial elements composing the population of the South had been evenly diffused throughout that section of the country in 1910, the proportion Negro in the population of each county would have been, as it was in the South as a whole, 29.8 per cent. Under this assumption, the proportion white in the population would have been 69.9 per cent, leaving a small fraction of 1 per cent to represent population of other racial character. In fact, however, the proportion Negro in the population of southern counties varied in 1910 from zero to 94.2 per cent, and conversely the proportion white varied from 100 to 5.8 per cent. This wide range of variation from county to county indicates that the geographic distribution of the Negro population in the South differed materially from that of the white population, and that in this sense at least a considerable degree of segregation or separation of Negro and white elements obtained as a present condition.

Statistics showing the proportion Negro by counties do not uncover that segregation of elements which obtains more or less generally within the counties themselves—in urban communities by wards or city blocks, and in rural subdivisions by neighborhoods. No tabulation has been made from census schedules to cover this neighborhood grouping of racial elements, but such a tabulation could not materially increase the significance of the data as regards the relative geographic distribution of these elements, or changes in that distribution, since the disposition of the racial elements within county areas by small neighborhood communities is determined by factors quite independ-

ent of those which determine the geographic distribution and drift of these elements in the country as a whole.

It may be remarked that migration northward in recent decades has depleted the Negro population in certain sections of the South and has in consequence accentuated the relative concentration of the Negro element in other sections. A decline in the proportion Negro in any section does not, however, of course necessarily imply emigration of Negroes from that section either to the North or to any other southern community. Such a decline is, on the contrary, entirely consistent with, and is in fact, frequently associated with rapid growth of both Negro and white elements, by natural increase supplemented by immigration. Obviously increase or decrease in the proportion Negro is dependent not upon the increase or decrease of the Negro element alone, but upon the increase or decrease of the Negro and white elements relatively to one another.

In the following sections of this chapter the areas and Negro populations of counties and the Negro-population increases are classified with reference to the proportion Negro in the population, and with reference to changes in this proportion from census to census. The areas within which the proportion Negro in the population is relatively high, and within which it is relatively low, and the areas within which the proportion is increasing and within which it is decreasing are determined. Analysis of these data indicates that the relative increase of the Negro and white elements has been determined locally by diverse factors, which can not be summarized as constituting in the

aggregate any simple tendency, either of segregation or of diffusion of racial elements.

THE "BLACK BELT" COUNTIES.

In the four maps on page 115, the geographic distribution of the counties in which the proportion Negro in the population was 50 per cent or more is shown for the four census years 1860, 1880, 1900, and 1910, the counties in which the proportion Negro amounted to 75 per cent or more being also indicated.

It will be apparent upon examination of these maps that the area within which Negroes constituted a majority of the population in 1910 was in general largely coextensive with the corresponding area at each of the earlier censuses. At each census the area embraced a group of counties in eastern Virginia and North Carolina; a belt of counties extending from the South Carolina coast through South Carolina, central Georgia, and Alabama; and a detached area embracing a portion of the lower Mississippi River Valley. The general contour and extent of these areas has shown remarkably little change in a period of 50 years. It may be noted that this area of relatively high proportion Negro in the population corresponds generally with the area of relatively high density of Negro population, and it is the area popularly designated as the "black belt."

The number and area of counties in which the population was half or more Negro are shown in Table 5 for four census years, by divisions and states, together with decennial increases and decreases, and the percentage of total area embraced within these counties.

¹ Minus sign (-) denotes decrease.

NEGRO POPULATION.

In 1910 Negroes constituted 50 per cent or more of the total population in 264 counties, whose areas aggregated 147,219 square miles. The area of these counties constituted 16.8 per cent, or one-sixth of the total area of the South. In the South Atlantic division the majority-Negro counties constituted 28.5 per cent of the total area, in the East South Central 22.7 per cent, and in the West South Central 7 per cent.

In each of the Southern states except Delaware, West Virginia, Kentucky, and Oklahoma, there were counties in 1910 in which Negroes constituted 50 per cent or more of the population. In each of these states, however, except South Carolina and Mississippi, the number of such counties fell off during the decade 1900-1910—in South Carolina the number increased from 30 in 1900 to 33 in 1910, and in Mississippi it was 38 in each year. In the South as a whole the number of these majority-Negro counties

decreased from 286 to 264, or by 22; the area from 166,742 to 147,219 square miles, or by 19,523 square miles.

The figures for 1890 and the increases and decreases for the two decades, 1880-1890 and 1890-1900, are probably affected by the undercount at the census of 1890, which by understating the Negro population may have reduced the number of counties in which the proportion Negro amounted to 50 per cent or more.

In Table 13 (p. 134) the percentage Negro in the population of each of the 264 counties covered by Table 5 is shown for 1910 and for 1900, and also the number of Negroes per 1,000 whites. The total Negro and white populations of these counties are given by divisions and states for four census years in Table 6, with the percentages which these populations respectively form of the total Negro and white population of the state or division.

NEGRO AND WHITE POPULATION OF COUNTIES IN WHICH THE PROPORTION NEGRO IN THE POPULATION WAS 50 PER CENT OR MORE, BY DIVISIONS AND STATES: 1910, 1900, 1890 AND 1880.

Texas.....																

The Negro population living in counties in which Negroes constituted a majority of the population in 1910 amounted to 3,932,484, or 44.9 per cent of the total Negro population of the South. In 1900 the population of majority Negro counties amounted to 4,057,619, or 51.2 per cent of the Negro population of the South; in 1890 to 3,555,970, or 52.6 per cent; and in 1880 to 3,392,235, or 57 per cent. While, therefore, the population aggregate for counties in which the population was 50 per cent or more Negro was greater in 1900 than in 1880, this aggregate constituted in 1900, as compared with 1880, a smaller proportion of the total Negro population. In the decade 1900-1910 the population aggregate for the black belt

counties decreased absolutely as well as relatively to the total Negro population of the South, the population aggregate for this class of counties being 3.1 per cent less and for other counties 24.6 per cent greater in 1910 than in 1900. The areas compared are, of course, as regards each class of counties in the several census years, not entirely identical.

In 1910 the white population of the majority-Negro counties was 2,094,964, or 10.2 per cent of the total white population of the South. The average number of Negroes per 1,000 whites in these counties, which occupied one-sixth of the total area of the South, was 1,877, and the proportion Negro in the total population approximately 65 per cent.

In each of the Southern states in which there were counties having a population more than one-half Negro the proportion of the total Negro population living in such counties was smaller in 1910 than it was in 1900, although in the case of four states the Negro population living in this class of counties was greater in 1910. In the case of the white population, a smaller proportion was in every southern state, without exception, living in the majority Negro counties in 1910 than in 1900.

AREA OF SPECIFIC PROPORTION NEGRO IN THE POPULATION: 1880-1910.

In Table 7 southern counties and their areas are classified according to the percentage Negro in their populations in 1910, the number of counties and the aggregate areas in square miles and in percentage of total area being shown for classes of counties in which

the proportion Negro in the population was, respectively, less than 12.5 per cent—in which class are included counties reporting no Negro population—12.5 to 24.9 per cent, 25 to 49.9 per cent, 50 to 74.9 per cent, and 75 per cent or more.

In 540 southern counties, with an aggregate area of 391,273 square miles, or 44.5 per cent of the total area of the South, the percentage Negro in the population in 1910 was less than 12.5. The aggregate area of the 202 counties in which the percentage Negro was 12.5 to 24.9 per cent amounted to 14.1 per cent of the total area of the South; that of the 345 counties with a percentage Negro ranging from 25 to 49.9, amounted to 24.6 per cent of the total area; that of the 211 counties with a percentage Negro of 50 to 74.9, amounted to 12.9 per cent of the total area; and that of the 53 counties in which the percentage Negro was 75 or more, to 3.9 per cent of the total area.

SOUTHERN COUNTY AREAS CLASSIFIED ACCORDING TO SPECIFIC PERCENTAGE NEGRO IN THE POPULATION BY DIVISIONS AND STATES: 1910.

¹ Includes counties reporting no Negro population.

The area of counties in which the percentage Negro was less than 12.5 constituted 19.5 per cent, or nearly one-fifth of the total area of the South Atlantic division; 33.2 per cent or nearly one-third of the area of the East South Central division, and 65 per cent, or nearly two-thirds of the area of the West South Central division. In Mississippi such counties constituted only 2.1 per cent of the total area of the state, while in West Virginia they constituted 92.4 per cent.

In eight Southern states in 1910 counties were reported in which the Negro population amounted to 75 per cent or more of the total population, and in Mississippi such counties constituted 22.9 per cent of the total area of the state.

The proportion Negro in the population is represented graphically, by counties, in the frontispiece map

and in the series of state maps introduced at the close of this chapter.

Data relating to the area of counties, classified as in Table 7, according to percentage Negro in the population, are given in Table 8 for southern divisions, covering the last four censuses.

Counties in which the percentage Negro was less than 12.5 per cent, including in this class counties reporting no Negro population, constituted a slightly smaller proportion of the total area of the South in 1910 than such counties did in 1900, and a somewhat larger proportion than they did in 1880. In the South Atlantic and in the West South Central divisions the percentage for this class of counties fell off, and in the East South Central division it increased during the decade 1900-1910. In each division there

NEGRO POPULATION.

was a slight decrease in the area of counties in which the percentage Negro was 75 or more, and also in the area of counties in which the percentage Negro was

from 50 to 74.9. In each division the area of counties in which the percentage Negro was 12.5 to 24.9 per cent increased during the decade.

SOUTHERN COUNTY AREAS CLASSIFIED ACCORDING TO SPECIFIC PERCENTAGE NEGRO IN THE POPULATION, BY DIVISIONS: 1910, 1900, 1890, AND 1880.

¹ Includes counties reporting no Negro population.

NEGRO POPULATION.

Comparing 1880 with 1910 it will be found that the proportion of the Negro population living in each class of counties in which the percentage Negro was less than 50 has increased; the proportion living in counties in which the percentage Negro was 50 to 74.9 has decreased very considerably—from 44.9 to 32.8 per cent; while the proportion living in counties in which the percentage Negro was 75 or more was practically the same in 1910 as in 1880, though lower than in 1900. Corresponding changes have taken place in each of the three southern divisions, although it may be noted that in the East South Central division the proportion living in counties in which the percentage Negro was 75 per cent or more increased from 21.9 per cent of the total Negro population in 1880 to 26.6 per cent in 1910. The proportion living in such counties increased in Mississippi from 31.3 per cent in 1880 to 39.2 per cent in 1910, and in Arkansas from 15.7 to 21.3 per cent.

It decreased in South Carolina, Georgia, Florida, Alabama, and Louisiana.

INCREASE AND PROPORTION NEGRO, BY COUNTIES.

A comparison of the rates of growth of the Negro population during the decade 1900-1910 in the several classes of counties for which data are presented in the tables preceding is made in Table 10. In determining the increases and decreases shown in this table, the counties have been classified according to the percentage Negro in the population in 1910, and the Negro populations in 1910 and in 1900 of the counties so grouped have been compared. The increase or decrease pertains in each case, therefore, to a specific group of counties, and indicates population change within a specific aggregate area, characterized as having in 1910 a given proportion of Negroes in the enumerated population.

INCREASE OR DECREASE OF NEGRO POPULATION IN SOUTHERN STATES CLASSIFIED BY PROPORTION NEGRO IN THE POPULATION IN 1910, BY SOUTHERN DIVISIONS AND STATES: 1900-1910.

¹ See note to Table 2.

While the percentages of Table 10 do not indicate that the rate of growth of the Negro population varies in any regular or close correspondence with the proportion Negro in the population, the aggregates for the South as a whole and for southern divisions would seem to justify the generalization that the rate of increase of the Negro population is relatively low in counties in which the percentage Negro is high. In the South, as a whole, the percentage increase was lowest during the decade 1900-1910 in that class of counties in which the proportion Negro was highest, and increased from class to class as the proportion Negro declined—except that the percentage increase was somewhat higher for the 25 to 49.9 per cent counties than it was for the 12.5 to 24.9 per cent counties. The percentage increases for the several classes of counties, beginning with the class having the highest proportion of Negroes in the population, ran as follows: 4.4, 7.6, 13.8, 10.5, and 18.

It should be noted, however, that the percentage for the class of counties having less than 12.5 per cent Negro in the population is largely determined by Oklahoma's increase, which as has been explained is not figured by counties. If the increase in Oklahoma could have been figured by counties some of it would have been thrown into classes of counties with a percentage Negro higher than 12.5, since in 14 of the state's 76 counties in 1910 the percentage Negro exceeded 12.5.

In each division the percentage increase for each of the two classes of counties in which the proportion Negro exceeded 50 per cent was below the average increase per cent of the Negro population in the South as a whole, while for counties having a percentage Negro of 25 to 49.9 per cent the percentage increase in each division exceeded the average for the population as a whole.

Arkansas is the only state in which the percentage increase for counties having, in 1910, a proportion Negro of 75 per cent or more exceeded the percentage increase for each class of counties with a lower pro-

portion Negro. In nine Southern states, counties having a proportion Negro of less than 12.5 per cent showed a decrease of Negro population during the decade 1900-1910, the decrease amounting in the case of Tennessee to 13.4 per cent. In only three states was the increase for this class of counties as great as the average increase of the Negro population as a whole in the South. More than one-half of the total Negro increase in the South—418,229 out of 826,458—was in counties in which the proportion Negro was 25 to 49.9 per cent. The increase in these counties amounted to 13.8 per cent, and was accordingly considerably above the percentage increase of 10.4 for the South as a whole. For counties in which the proportion Negro was 50 to 74.9 per cent the increase amounted to 198,659, or 7.5 per cent, the rate of growth in these counties being considerably below the rate for the South as a whole. These two classes of counties account for approximately three-fourths of the total Negro increase at the South.

It will be obvious that increase of the Negro population in counties in which the proportion is low has a significance entirely different from that of an increase in proportion pertaining to counties in which the proportion is high, the tendency being in the one case toward more even dispersion of the Negro element and in the other toward further agglomeration.

PROPORTION NEGRO AND DENSITY OF NEGRO POPULATION.

While in general it is true, as has been noted, that the counties with a high proportion Negro in the population are characterized also by a relatively high density of Negro population, there is no close correlation of proportion Negro and density of population in detail. This will be apparent in Table 11, in which are shown the proportion Negro and the Negro population per square mile for each of the 53 counties with a proportion Negro in the population of 75 per cent or more in 1910, the counties being arranged in order according to the proportion Negro.

PROPORTION NEGRO AND NEGRO POPULATION PER SQUARE MILE FOR THE 53 COUNTIES IN WHICH THE PROPORTION NEGRO WAS 75 PER CENT: 1910.

NEGRO POPULATION.

In this group of counties the largest Negro population per square mile was that of 51.6 in Terrell County, Ga., whose proportion Negro was 75.5 per cent. The smallest population per square mile was that of 10.6 in McIntosh County, Ga., whose proportion Negro was 77.3 per cent. In Issaquena County, Miss., whose proportion Negro of 94.2 per cent exceeded that of any other county, the Negro population per square mile was 24.5.

AREA OF INCREASING AND DECREASING PROPORTION
NEGRO: 1900-1910.

Southern counties and county areas have been classified in Table 12 according to increase or decrease of the percentage Negro in the population during the decade 1900-1910. The aggregate area within which the proportion Negro in the population increased, and within which it decreased in this decade is given, in square miles and in percentage of total area, for the South as a whole, and for each southern division and state.

The percentage Negro increased during the decade 1900-1910 in 276 county areas and decreased in 807, there being in the case of 143 areas either no Negro population or a Negro population of less than 100 reported in both 1900 and 1910. The area of counties

in which the proportion Negro increased amounted to 275,908 square miles, or 31.4 per cent of the total area of the South; that of counties in which it decreased to 465,445 square miles, or 53 per cent of the total area.

In the West South Central division the proportion Negro in the population decreased in counties whose aggregate areas constituted 37.3 per cent of the total area of the division; the counties of decreasing proportion Negro constituted 64.8 per cent, or nearly two-thirds, of the total area in the South Atlantic division; and 72.9 per cent, or nearly three-fourths, of the total area in the East South Central division.

Except in the case of Florida, the area of counties in which the proportion Negro in the population decreased in the several Southern states, exceeded that of the counties in which the proportion increased. In Florida the counties in which the proportion Negro decreased embraced 28.2 per cent of the total area of the state; the corresponding percentage for Texas being 33.7; for Delaware and Maryland, 53.5; for West Virginia, 60; for Georgia, 62.1; for Alabama, 62.4; for Mississippi, 62.8; for Arkansas, 69.5; for North Carolina, 73.7; for Louisiana, 77.9; for Kentucky, 81.1; for South Carolina, 83.7; for Virginia, 88.4; for Tennessee, 89.

1 See note to Table 2.

The map on page 133 represents the distribution of those counties in the country as a whole, having a Negro population in 1910 of at least 1,000, and showing a proportion Negro in the population higher in 1910 than in 1900. In this map the comparison as regards

Oklahoma is of 1910 with 1907, comparable data for 1900 not being available. It will be noted that in a number of northern counties, including some of the larger urban communities, the proportion Negro increased.

MAP VII.—COUNTIES HAVING AT LEAST 1,000 NEGROES IN 1910, AND A PERCENTAGE NEGRO IN THE POPULATION HIGHER IN 1910 THAN IN 1900.
(Counties having a higher percentage are indicated by the shading. For Oklahoma the comparison is of 1910 with 1897.)

CHAPTER IX.—SEX COMPOSITION.

NEGRO MALES AND FEMALES AT EACH CENSUS: 1820-1910.

The Negro population was returned by sex for the first time at the census of 1820. At this and the succeeding census the number of males exceeded the number of females, but at each of the eight censuses, 1840-1910, the number of females has exceeded the number of males.

In 1910 the number of males was 4,885,881, the number of females, 4,941,882, and the excess of females, 56,001. The sex ratio—i. e., number of males per 1,000 females in the population—in 1910 was 989. This ratio indicates that on the average per 1,000 Negro population the number of males was 497 (or 49.7 per cent), of females 503 (or 50.3 per cent), and the average excess of females 6 (or 0.6 per cent of the Negro population). In terms of population, the sex ratio of 989 signifies that on the average, in a population in which there were 1,000 females, there would be 989 males, giving an excess of females over males of 11 in a population of 1,989. These are equivalent statements of the proportion of males to females in the Negro population in 1910.

The number of males and of females in the Negro population, the excess of males or of females, and the number of males per 1,000 females, at each census, 1820 to 1910, is given in Table 1.

YEAR.	NEGRO POPULATION.					
	Both sexes.	Male.	Female.	Excess of—		Males to 1,000 females.
				Males.	Females.

1820.....	1,771,656	900,796	870,860	29,936	1,034

The sex ratio in the Negro population is little affected by emigration or immigration. In a sense it is a natural ratio for this class of the population, since it is practically determined by the ratio at birth, and the mortality rate of males and of females. There are, however, no statistics available for the Negro population, or for any class of population, in the United States as a whole, which determine accurately the sex ratio at birth. The age returns show the sex

distribution of the population under 1 year of age, and within the area of registration for deaths, the mortality of children under 1 year by weeks and months is shown. But only a comparatively small proportion of the Negro population is resident within the registration area, and neither the age returns nor the mortality returns are sufficiently accurate and detailed to determine the sex ratio at birth. In countries with accurate birth statistics it seems to be generally true that the number of males exceeds the number of females at birth. In France, for example, among living births in 1910 the number of males was 395,669 and of females 378,721, the number of males to 1,000 females being 1,046.

As appears in the analysis of the age returns (see diagram on page 163), there is a slight excess of females in the Negro population under 1 year of age; a marked excess in the age period 15 to 29 years; and a deficiency at each year of age, with exception of a few years, in the age period 30 to 85 years. The sex ratio is an average covering all ages. It shows that the excess of females in the younger ages overbalances the excess of males in the more advanced ages.

The excess of females over males in the Negro population has appeared persistently in the census returns covering a period of 70 years. The excess was greatest absolutely and relatively, at the census of 1870, which gave a ratio of 962 males to 1,000 females, covering an excess of females numbering 93,493. The proportion of males for this class of the population, as for other classes, may have been reduced by the war, but it is not improbable that the ratio was affected by the undercounting at the census of 1870. If the returns at the census of 1890—also, as regards the Negro population, a defective enumeration—be disregarded, it would appear that the proportion of males in the Negro population has increased somewhat in recent decades—from 978 males per 1,000 females in 1880, to 986 in 1900, and to 989 in 1910. The proportion in 1910 was only slightly different from the proportion in 1850.

It may be noted that outside of Europe an excess of males is more common in the population of different countries than an excess of females. A compilation made in the Thirteenth Census, covering countries which embraced approximately one-half of the population of the world in 1900 gave a sex ratio of 1,009 males to 1,000 females for this population aggregate. Europe was the only continental area showing an excess of females, the number of males to 1,000 females

in the population of Europe being 967. The sex ratio for European countries generally has been lowered by emigration, since more males emigrate than females. In France, however, whose population is not greatly affected by emigration, the number of males to 1,000 females in 1910 was 967. In France the proportion of males in the population had decreased very slightly at each quinquennial census since 1880.

SEX RATIO BY CLASSES.

Figures corresponding to those given in Table 1 for the Negro population as returned at each census, 1820 to 1910, are given in Table 2 for each class of the population as returned in 1910.

RACIAL CLASS.	POPULATION: 1910.				
	Male.	Female.	Excess of—		Males to 1,000 females.

All other.....	3,062	83	3,009	(¹)

¹ Number of females less than 100.

In those classes of the population which are entirely or largely immigrant—the foreign-born white, the Chinese and the Japanese—the proportion of males to females greatly exceeds any natural proportion determined by the sex ratio at birth and mortality. In these classes the ratio ranged in 1910 from 1,292 males to 1,000 females among foreign-born whites to 14,301 males to 1,000 females among the Chinese. Since, however, the Negro population is almost entirely native, comparison with the immigrant classes has little significance. In the native white population, and in the Indian population, which like the Negro is a native element, the number of males exceeded the number of females, the ratio for the native white population being 1,027, and for the Indian 1,035 males to 1,000 females. In the native white population of native parentage the number of males exceeded the number of females by 969,861, giving an average for this class of 1,040 males to 1,000 females. Among native whites of mixed parentage (one parent native and one foreign born) and of foreign parentage (both parents foreign born), on the other hand, the number of females exceeded the number of males.

Probably the sex ratio in these three classes of native whites is somewhat affected by errors in classification by nativity and parentage. Persons of unknown nativity were classified as native and persons of

unknown parentage as of native parentage. Moreover, some foreign-born persons may have returned themselves or may have been returned by the enumerator in the absence of specific information, as natives, and some as natives of foreign or mixed parentage may have returned themselves or may have been returned as of native parentage. As males predominate in the foreign-born population, the classification of foreign-born persons as natives would tend to raise the proportion of males in the native population. It is probably true also that specific information was lacking more frequently in the case of males than of females, since males are more apt to be absent from home when the enumerator calls. It is believed, however, that these errors are not sufficient to account for the entire excess of males in the native white population. This class has shown an excess of males at each census at which the population has been returned by nativity.

In Table 3 the sex ratio is shown for the Negro population and for nativity and parentage classes of the white population at each census for which data are available.

¹ No data available.

With exception of a decrease for 1870, the proportion of males to females in the native white population has remained fairly constant, an excess of males being revealed at each census beginning with that of 1850, which was the first census to distinguish the native and the foreign-born elements in the white population. At each of these censuses, as has been noted, the Negro population revealed an excess of females.

SEX RATIO OF NEGRO AND WHITE POPULATION, BY SECTIONS AND DIVISIONS.

The sex composition of the Negro population in 1910 is shown, by sections and southern divisions, in Table 4, together with the sex ratio for the Negro population at four censuses, and of the native and foreign-born white population at the census of 1910.

There was a deficiency of males in the Negro population of the South as a whole, and an excess of males

SEX COMPOSITION.

149

in the Negro population of the North and West in 1910. During the decade 1900-1910, however, the number of males per 1,000 females decreased markedly

in the West—from 1,306 in 1900 to 1,207 in 1910—and the decrease in the preceding decade, from 1,575 in 1890, was equally marked.

NEGRO POPULATION CLASSIFIED BY SEX, 1910; NEGRO SEX RATIO, 1880-1910; AND SEX RATIO FOR WHITE CLASSES, 1910: BY SECTIONS AND SOUTHERN DIVISIONS.

SECTION AND DIVISION.	NEGRO POPULATION: 1910.			MALES TO 1,000 FEMALES.

South Atlantic.....	4,112,458	2,029,808	2,082,680	52,872	975	969	979	968	1,032	1,018	1,469
East South Central.....	2,632,513	1,315,702	1,336,721	29,929	984	983	973	971	1,036	1,031	1,392
West South Central.....	1,984,426	994,025	990,401	3,624	1,004	999	1,012	997	1,063	1,079	1,388
The North.....	1,027,674	518,544	509,130	9,414	1,018	1,017	1,030	997	1,050	1,007	1,235
The West.....	50,662	27,712	22,950	4,762	1,207	1,306	1,575	1,414	1,262	1,153	1,845

Within the South itself the West South Central division showed in 1910 a slight excess of males over females. The proportion of males was lowest in the South Atlantic division, in which the number of males to 1,000 females was 975. In the East South Central division it was 984, and in the West South Central 1,004. During the decade the proportion of males increased in the South Atlantic and in the West South Central divisions, and decreased in the East South Central division.

In each division of the South the native white population returned an excess of males, the relative excess being least in the South Atlantic division—with a ratio of 1,018 males to 1,000 females, and greatest in the West South Central division, 1,079 to 1,000.

SEX COMPOSITION OF NEGRO POPULATION, BY STATES: 1910, 1900, 1890, AND 1880.

In Table 5 (p. 150) the number of Negro males and females and the sex ratio are given, by states, for four census years, and for 1910 the excess of males or of females.¹

In 10 Southern states and in the District of Columbia females were in excess in the Negro population in 1910, and in 6 Southern states males were in excess. Among these states the proportion of males was highest in West Virginia, in which state the number of males per 1,000 females in the Negro population was 1,328. The other states showing an excess of males in the Negro population were Delaware, Florida, Kentucky, Arkansas, and Oklahoma. In all of the Northern and Western states except in a group of contiguous states in New England and the Middle Atlantic divisions—i. e., Massachusetts, Rhode Island,

Connecticut, New York, New Jersey, and Pennsylvania—males were in excess in the Negro population. As is shown in a subsequent table (Table 14) the excess of females in these six states is confined to the urban population, which is sufficiently large to more than offset by its sex distribution the excess of males in the rural population.

In 9 Southern states and in the District of Columbia the proportion of males increased during the decade 1900-1910; in 6 states it decreased, and in 1 state it remained unchanged. As compared with 1880, the proportion of males was higher in 1910 in 10 Southern states and the District of Columbia, and lower in 5 states.

In Table 6 (p. 151) the states are arranged in order according to the sex ratio in the Negro population in 1910, 1900, and 1890, and the Negro population is cumulated by states.

The proportion of males in 1910 was lowest in the District of Columbia and highest in Vermont, the number of males per 1,000 females being 822 in the District and 2,618 in Vermont. In 1900 and in 1890 also the proportion was lower in the District than in any state. In both of these years the proportion was highest in Arizona—in 1900 2,810 and in 1890 6,375 males to 1,000 females. The median ratio (i. e., the ratio of the median population in the cumulated populations of Table 6) was lower in 1910 than in 1900, although the average ratio for the population as a whole was higher. The very high ratios in each of the three years covered by Table 6, however, relate generally to small Negro populations. In 1910, for example, 99 per cent of the Negro population lived in states in which the number of males did not exceed 1,185 per 1,000 females; 90 per cent lived in states in which the ratio did not exceed 1,046 to 1,000. In 1900, 99.3 per cent lived in states with ratios lower than 1,185, and in 1890, 99 per cent.

¹ The black and mulatto Negro population of states is classified by sex for the year 1860 in Table 24 of Chapter XI, and for 1910 in Table 26 of that chapter.

¹ Includes population of Indian Territory.

² Number of females less than 100 in Nevada for 1900 and 1890, and in Idaho for 1890.

In 1910, 81.2 per cent, or more than four-fifths, of the Negro population lived in states in which the number of females equaled or exceeded the number of males; in 1900, 84 per cent, and in 1890, 57.1 per cent.

The range of variation in the sex ratios was less in 1910 than it was in 1900 or in 1890.¹

¹ The quartile deviation in 1910 (i. e., one-half of the difference between the ratios of the quartile states by the cumulated populations of Table 6) was less than in 1900 but greater than in 1890, the deviations for these years being, respectively, 14.5, 18, and 11 in the number of males per 1,000 females. These figures indicate that the distribution of the Negro population by sex was somewhat more even from state to state in 1910 than it was in 1900 but was somewhat less even than in 1890, although the range of extreme variation was greater in 1890.

SEX RATIO IN THE "BLACK BELT."

The sex distribution of the Negro population of counties is given in General Table III.

In Table 7 aggregates and sex ratios are shown for southern counties in which Negroes constituted 50 per cent or more of the population in 1910, and for counties having a smaller proportion Negro.

In the aggregate for counties in which the population was 50 per cent or more Negro in 1910, the proportion of males was smaller than it was in the aggregate for other counties, in the country as a whole and in each of the three southern divisions, although in several

NEGRO POPULATION.

Southern states the proportion of males was higher in the majority Negro counties than in other counties. The differences between the sex ratios of these two aggregates may be associated in certain Southern states with the tendency which has been noted, of Negroes to move out of the black belt. While this movement is not simple in character, as regards the two sexes, it would appear that the tendency is stronger among males than among females. In Alabama, for example, the number of males to 1,000 females was 936 in the black belt counties and 1,017 in other counties. In Florida the number of males per 1,000 females in the majority Negro counties was 1,053, and in other counties 1,116. It would appear that the migration of Negro males into this state has been sufficient to raise the proportion of males in the population considerably above the average proportion in the Negro population as a whole, but to a much less degree in the majority Negro counties as compared with other counties.

The sex composition of the Negro population of any county may, however, be variously affected by the migratory shiftings of the population, which in some cases tend to increase and in other cases to diminish the proportion of males to females. Throughout the country the rural Negro population is predominantly male, and the urban Negro population is predominantly female.

Negro population locally. Obviously a county will be variously affected by these migratory shiftings according as it is receiving or is sending forth migrants, according as it is urban or rural in character, and, if rural, according as it is fully or only incompletely exploited agriculturally, and finally according as it is proximate to or remote from large urban centers. Local variations in sex ratios reflect the influences of migratory shiftings of population, and would not develop to any appreciable extent in the absence of such shiftings.

URBAN AND RURAL POPULATION.

In Table 8 the sex ratio in 1910 and in 1900 is given for the urban and rural Negro population and white population classes.

RACIAL CLASS.	MALES TO 1,000 FEMALES.

The migration into northern and western communities is partly rural and partly urban in direction, and within the South also these two sorts of migrations are continuously modifying the sex composition of the

Among Negroes in 1910 the number of males per 1,000 females was 908 in the urban population and 1,021 in the rural. During the decade the proportion of males increased in the urban Negro population, but remained unchanged in the rural population. Among native whites of native, mixed, and foreign parentage, as among Negroes, there was a deficiency of males in the urban population and an excess of males in the rural, and among foreign-born whites the excess of males was much greater in the rural than it was in the urban population.

In Table 9 the sex ratio is given for the urban Negro population by classes of urban communities.

	NEGRO POPULATION: 1910.							
	Total.	Urban communities.						Rural communities.
		Places of 500,000 or more.	Places of 100,000 to 500,000.	Places of 25,000 to 100,000.	Places of 10,000 to 25,000.	Places of 2,500 to 10,000.		
Both sexes.....	2,689,229	396,613	626,916	602,040	408,382	655,266	7,138,534	
Male.....	1,279,484	189,837	297,674	286,286	193,721	311,965	3,606,397	
Female.....	1,409,745	206,778	329,272	315,754	214,661	343,300	3,532,137	
Excess—								
Of males.....							74,260	
Of females.....	180,261	16,941	31,598	29,468	20,920	31,334		
Males to 1,000 females.....	908	918	904	907	903	909	1,021	

The ratio does not appear to vary in any fixed relationship with reference to size of community, the de-

iciency of males being most marked in places of 10,000 to 25,000 inhabitants, in which the number of males per 1,000 females was 903, and least marked in places of 500,000 or more, in which it was 918. The predominance of females in the urban population seems to be determined by conditions which obtain generally in small as well as in large urban communities. Males may enter more largely into the long-distance migration to the large cities of the North, than they do into the relatively short-distance migration to the smaller cities in the country as a whole.

Table 10 gives the sex ratio by classes of urban communities for the Negro and white classes. In this table, also, the variations in the sex ratios seem to be determined by factors other than size of urban community.

Table 10 MALES TO 1,000 FEMALES: 1910.

RACIAL CLASS.	Urban population.						Rural population.
	Total.	Places of 500,000 to 1,000,000.	Places of 100,000 to 500,000.	Places of 25,000 to 100,000.	Places of 10,000 to 25,000.	Places of 2,500 to 10,000.

RURAL COMMUNITIES.							
United States.....	1,021	1,111	1,072	1,067	1,095	1,611	
The South.....	1,015	1,070	1,059	1,057	1,114	1,686	
South Atlantic.....	1,010	1,033	1,041	1,039	1,098	2,193	
East South Central.....	1,011	1,050	1,046	1,045	1,101	1,792	
West South Central.....	1,033	1,108	1,094	1,092	1,121	1,488	
The North.....	1,175	1,165	1,061	1,056	1,076	1,484	
The West.....	1,827	1,382	1,240	1,249	1,217	2,333	

The excess of females in the urban Negro population was most marked in the South, and among southern divisions, in the South Atlantic division, in which the number of males per 1,000 females was 860. In the rural population of this division there were 1,010 males to 1,000 females. Similar, but somewhat less considerable differences in the proportions for the urban and rural populations obtain in the East and West South Central divisions. In the North the number of males per 1,000 females was 977 in the urban population, and 1,175 in the rural; in the West, 1,083 in the urban, and 1,827 in the rural. The proportion of males is higher among native whites than among Negroes, in both the urban and the rural population of the South, and lower among native whites than among Negroes in the urban and rural population of the North and West. Inasmuch as the urban population is increasing by net migration from country districts, the ratios shown in Table 11 indicate that this migration cityward in the Negro population is predominantly female as regards urban communities in the South.

Table 12 (p. 154) gives for each of the nine geographic divisions the number of Negro and white males and females in the urban and rural population, covering the two years, 1910 and 1900.

Table 13 (p. 154) gives similar data by divisions for classes of urban communities in 1910.

Table 14 (p. 155) classifies the urban and rural Negro population of the states in 1910, by sex, giving the sex ratio for each class of population. In every state except Vermont, North Dakota, Oklahoma, Nevada, and Minnesota the proportion of males in the rural Negro population exceeded that in the urban. Among the Southern states in the urban population the proportion was lowest in Mississippi, 823 males to 1,000 females, and highest in Oklahoma, 1,115 males to 1,000 females; in the rural population the proportion was lowest in North Carolina, 972 males to 1,000 females, and highest in West Virginia, 1,424 males to 1,000 females. West Virginia and Oklahoma were the only Southern states showing an excess of males in the urban population, and North Carolina, South Carolina, and Alabama, the only Southern states showing an excess of females in the rural population. In the North Central states, except Wisconsin and Kansas, males are in excess in both the urban and rural populations, and this condition obtains in some other states with small Negro populations, in which males largely predominate.

PRINCIPAL CITIES.

Tables 15 and 16 (pp. 156 and 157) present data for cities. In Table 15 the number of Negro males and females and the sex ratio are shown for cities of 100,000 or more population, covering the years 1910, 1900, and 1890, together with the sex ratio in 1910 for classes of

NEGRO POPULATION.

the white population. Table 16 gives the Negro population by sex, and the sex ratio in 1910, for cities of 25,000 to 100,000 population. In both these tables the cities are grouped by sections, totals being given for each section.

In 1910 there were 9 southern cities having a population of 100,000 or more, and in the Negro pop-

ulation of each of these cities the females outnumbered the males, the lowest proportion of males being that of Nashville, Tenn., in which the number of males to 1,000 females was 800. The lowest proportion for any northern or western city was that of Worcester, Mass., 849 males to 1,000 females. The highest proportion was that of San Francisco, 1,661 males to 1,000

SEX COMPOSITION.

155

females. In New York City there were 850 males to 1,000 females. In this group of cities the proportion of males increased in each section of the country during the decade 1900-1910, although there were 14 northern and western cities and 1 southern city, Memphis, in which the proportion decreased.

The Negro populations of northern and western cities of 25,000 to 100,000 population, are generally small, and in a number of these cities males outnumbered females in 1910. In only 5 of the 35 southern cities of this group, however, was there an excess of males over females.

TABLE 14.—URBAN AND RURAL NEGRO POPULATION CLASSIFIED BY SEX, WITH SEX RATIO AND PERCENTAGE URBAN, BY DIVISIONS AND STATES: 1910.

DIVISION AND STATE.	NEGRO POPULATION: 1910.										
	Urban communities.			Rural communities.			Males to 1,000 females.		Percentage urban.		
	Both sexes.	Male.	Female.	Both sexes.	Male.	Female.	Urban communities.	Rural communities.	Both sexes.	Male.	Female.

CHAPTER X.—AGE COMPOSITION.

THE AGE INQUIRY.

Returns of age for the Negro population have been made at each census, beginning with that of 1820, which distinguished four age classes in the returns of free colored persons and of slaves. The age classes distinguished at the several censuses, 1820-1910, for the colored and white population elements, are given in Table 1.

Table 1 AGE CLASSES SHOWN, BY SEX, AT SEVERAL CENSUSES: 1820-1910.

1820		1830 and 1840		1850 and 1860	1870	1880-1910
Colored. ¹	White.	Colored. ¹	White.	Colored ¹ and white classes.		
Under 14 yrs. 14 to 25 yrs. 26 to 44 yrs. 45 yrs. and over.	Under 10 yrs. 10 to 15 yrs. 16 to 25 yrs. 26 to 44 yrs. 45 yrs. and over. Males between 16 and 18 yrs.	Under 10 yrs. 10 to 23 yrs. 24 to 35 yrs. 36 to 54 yrs. 55 to 99 yrs. 100 yrs. and over.	Under 5 yrs. 5 to 9 yrs. 10 to 14 yrs. 15 to 19 yrs. 20 to 28 yrs. 30 to 39 yrs. 40 to 49 yrs. 50 to 59 yrs. 60 to 69 yrs. 70 to 79 yrs. 80 to 89 yrs. 90 to 99 yrs. 100 yrs. and over.	Under 1 yr. 1 to 4 yrs. 5 to 9 yrs. 10 to 14 yrs. 15 to 19 yrs. 20 to 29 yrs. 30 to 39 yrs. 40 to 49 yrs. 50 to 59 yrs. 60 to 69 yrs. 70 to 79 yrs. 80 to 89 yrs. 90 to 99 yrs. 100 yrs. and over. Unknown.	Under 1 yr. 1 to 4 yrs. 5 to 9 yrs. 10 to 14 yrs. 15 to 19 yrs. 20 to 29 yrs. 30 to 39 yrs. 40 to 49 yrs. 50 to 59 yrs. 60 to 69 yrs. 70 to 79 yrs. 80 to 89 yrs. 90 to 99 yrs. 100 yrs. and over. Unknown.	By single years of age.

¹ The free colored population and the slave population are shown separately at each of the five censuses, 1820 to 1860. In the reports of these censuses and at the census of 1870 the term "colored" is used to designate the Negro population; in subsequent censuses the aggregate colored embraces Indians, Chinese, and Japanese, with Negroes. In 1880 and 1890 the age tabulation is given for the aggregate colored only, although for some age periods data are available in the 1890 census for Negroes separately from other colored. In 1900 and 1910 single years of age are shown for Negroes, separately from other colored.

At the censuses of 1830 and 1840, the age classification for the colored population was somewhat more detailed than it was in 1820, but at each of the three censuses—1820, 1830, and 1840—less detail by age was shown for the colored than for the white population. Beginning with 1850, the same detail by age is shown at each census for the colored as for other classes.

The classification in the censuses of 1850 and 1860 is by five and ten year periods, the number under 1 being shown separately. The 1870 classification is by five-year periods to the age of 79 and by ten-year periods for the ages 80 to 99, with detail by single years for the population under 5, and by special groupings for the population 15 to 24. At each of the last four censuses, 1880-1910, the age returns have been tabulated for race and nativity classes, by single years of age.

The 1910 population schedule called for a return of age at last birthday by full years, and in the case of

children under 2 years of age, for a return of age by months.

In the tabulations based upon these returns the population is classified by completed years of age, a child being classified as five years of age, for example, during and until he has completed his sixth year. The average age of the population classified as five years of age is accordingly nearly five and one-half years.

VALUE OF AGE STATISTICS.

In many lines of statistical inquiry compilations have comparatively little significance except as they are developed under an age classification of the population. This is true generally of those compilations embraced under the designation of vital statistics and relating to mortality, duration of life, morbidity, and fecundity.

Deaths, for example, are reported by age of decedent, and to determine specific mortality rates, deaths classified by age must be related to the population similarly classified. Specific birth rates, marriage rates, fecundity rates, and morbidity rates, also as well as mortality rates, imply an age classification of the population.

While the age classification is fundamental in all vital statistics, its value is by no means restricted to this field of statistical compilation. In many lines of statistical inquiry relating to social conditions and progress, accurate age data are essential. This is obviously true of the inquiry relating to school attendance, where the number of children of school age attending school in any community is in itself a comparatively barren fact, which can acquire significance only through relation to the total population of that age, and to the number not in school. It is equally true of marital condition statistics that they are barren of significance except under an age classification, since age is one prime factor determining marital condition. Occupations statistics, also, derive significance in a large degree from the age classification, and it may be noted that, as regards the Negro element in the population, the age classification is extremely important in any analysis of the data relating to illiteracy, since the degree of illiteracy varies consistently with age. In other lines of inquiry, local and general, such, for example, as those relating to the dependent, the defective, and the delinquent classes, age groupings of the population are essential for the determination of significant indexes and proportions.

The Negro population is a native population, unaffected by immigration or emigration. Its age composition is, therefore, a natural composition determined by its rates of natality and of mortality. Changes in the relative size of the age classes composing the population necessarily reflect changes in one or both of these rates, and are significant of changes in social or economic conditions involving the welfare of the class. Since accurate and complete statistics of births and deaths are not available for the Negro population of the South, except in very restricted areas, the vital characteristics of this class, as regards fecundity and longevity, must be determined chiefly through an analysis of the age data.

The detail shown in the following age tables is presented for the value it may have in special lines of inquiry. The tables require comparatively little explanatory comment, and some of the discussion which might have been introduced in connection with them has been reserved for a separate chapter in which the number of children is related to the number of women of childbearing age.

RETURNS BY SINGLE YEARS OF AGE: 1910 AND 1900.

Although the population schedule called for a return of ages under 2 years by months, the unit of compilation in the following tables is a full year, the first 2 years of age being designated "under 1 year" and "1 year," respectively. Table 2, classifying the Negro population by sex and single years of age is, therefore, the basic age table, from which other tables are in large part derived by the combination of ages and the computation of percentages and ratios.

In the Negro population, which is increasing naturally by excess of births over deaths and is practically unaffected by immigration or emigration, the number of children under 1 year of age must generally under normal conditions exceed the number 1 year of age; the number 1 year of age must exceed the number 2 years, and similarly, throughout the life period, to the most advanced age reported, the number in any given year of age must generally exceed the number in the next succeeding year.

The decrease by single years of age represents principally the depletion of the population by mortality. Of the children under 1 year of age who survive to the end of their first year a certain number die in the age of 1 year; and of the survivors, a varying proportion die in each succeeding year of age. In the census tabulation by age, however, the decrease in population from age to age is not entirely due to mortality. The age classification shows the number of survivors among children born each year during a period preceding the census enumeration equivalent approximately to 100 years. A portion of the decrease by age represents, therefore, natural growth of population, which constantly brings forward into successive

ages in annual waves of population increase a larger number of individuals. Stated differently, it represents the decrease in number of children born each year, as one recedes into the past from the year of census enumeration. The number of children returned at the census as under 1 year of age, for example, are the survivors of children born during the 12 months preceding the enumeration, while the number returned as 1 year of age are the survivors of children born in the year ending 12 months prior to the enumeration; and if the number of births is increasing from year to year, the number of children returned as under 1 year will tend constantly to exceed the number sufficient under the prevailing infant mortality rate to maintain without increase the population 1 year of age. Under these conditions the difference between the population under 1 and the population 1 year of age, at any given time, will represent in part annual increase in the number of children born and surviving, and in part the effects of mortality during the first two years of life. Similarly the decrease shown at other ages is in part an effect of population growth and in part an effect of mortality.

Under stable specific mortality rates natural increase of population advances through the successive years of age, creating a proportion in the younger ages which is constantly somewhat in excess of that required by the specific mortalities to maintain without increase the population in the older ages. Improvement in the specific mortality rates will affect the age composition of the population variously according to the specific mortality reduced—a reduction of infant mortality tending to increase the number and temporarily the proportion of children in the population, while a decrease of mortality in the older ages tends to increase the proportion surviving in these ages, thereby diminishing permanently the proportion in the younger ages.

In a classification of the population by single years of age the regular diminution of the age groups from age to age is modified by variations in the birth rate, and in specific mortality rates, during an extended period in the past—a period equal in duration to the life period of persons enumerated. An excessive infant mortality in some year may, for example, create a deficiency in the age group comprising the survivors of children born in that year. The age composition of the Negro population at the present time undoubtedly reflects in some slight variations from the normal or life table distribution in advanced ages the abnormal conditions prevailing during the decade of the Civil War.

Very slight variations from the normal or life-table age distribution may be accounted for as occasioned by accidental conditions in the past affecting birth and death rates, but any excessive variation shown in the tabulation of the census age returns is conclusive evidence of error in those returns.

In the case of the Negro population these errors have been very considerable at each census. They result in part from the fact that a large number of individuals enumerated are ignorant of their exact age; in part, from the fact that the person enumerated is not in every instance interviewed directly by the enumerator, the statement of age being in many such cases an estimate; and, in part, from the fact that age is in some cases intentionally misrepresented. A child, for example, may be erroneously returned as above the age limit of compulsory school attendance, or above the limit fixed in child-labor legislation. Males nearly 21 years of age may erroneously report themselves as of voting age, and in other cases age is intentionally understated.

Enumerators were instructed to report an estimate of age in any case where the exact age could not be ascertained, and in estimating ages of adults there is a marked tendency to report ages ending in 0 or in 5. To report, for example, a person approximately 50 years of age as exactly 50. An examination of Table 2, and of Diagram I, will reveal clearly the marked concentration upon these ages in the adult population, male and female. The number of males reported at the ages 29, 30, and 31 years, for example, is respectively, 65,666, 114,699, and 45,572; of females, 67,645, 118,858, and 44,171. The number reported for the age 30, in the case of both males and females, exceeded the number reported as 1 year of age. In the more advanced ages the concentration is relatively more marked, the numbers reported for the ages 59, 60, and 61, for example, being, in the case of males, 14,962, 49,275, and 10,565; and in the case of females, 12,475, 47,300, and 8,120. This sort of concentration is undoubtedly accounted for almost entirely by ignorance as to exact age, although in some cases, as has been noted, this ignorance pertains to the age not of oneself but of another person for whom one is filling out a schedule.

Tabulation of the age returns for the Negro population under 20 years of age develops in the age grouping irregularities quite different in character from those noted in the older population. In these younger ages there is a general concentration upon the even years of age, among both males and females. For the entire age period under 20 years, the number reported for each even year exceeds the number reported for the preceding odd year, with exception of the age 4 as compared with 3 among females and the age 8 as compared with 7 among males. The concentration upon even ages is especially remarkable in the age period 10 to 20 years, and for this period is more considerable among females than males. Some of this concentration may arise as an indirect consequence of compulsory school attendance and child-labor laws, in which even rather than odd years—12, 14, and 16 rather than 11, 13, and 15—are commonly specified as age limits. It would appear, however, that there is

a natural tendency in estimating the ages of young persons—whose ages can be more nearly approximated by estimate than can the ages of older persons—to fix upon even rather than odd years.

The deficiency in the number of children 1 year of age as compared with the number 2 years of age is probably to be accounted for largely by the return of some children in their second year of age as 2 years old. The relatively small number of children in the ages 1 year and under 1 year, as compared with the number 2, 3, and 4 years of age, would seem to indicate, however, a considerable number of omissions in the enumeration of infants.

The life-table age distribution of the Negro population is shown in comparison with that of the white population in the diagram included in the chapter on "Mortality in the registration area." While this life-table distribution undoubtedly approximates the actual distribution of the Negro population, it is to be noted that the life table is constructed upon data relating to certain of the registration states—all of them Northern states with a relatively small Negro population. The eccentric divergencies, however, of the age distribution of the Negro population, as enumerated, from the life-table distribution are occasioned principally by errors in the returns due to ignorance of exact age, and it may be remarked that a high degree of inaccuracy in age returns, such as characterizes the returns for Negroes, is commonly, as it is in the case of the Negroes, associated with a high degree of illiteracy.

Since it is based upon specific mortality rates calculated from data pertaining to deaths during the three years, 1909, 1910, and 1911, and to the population of restricted areas, the life-table distribution by age of Negro males and females may not represent accurately the natural age distribution in the country as a whole. A discussion of the life tables will be found in the chapter on mortality, but the essential differences in the two age distributions—the one based upon schedule returns of the total population and the other upon specific mortality data relating to certain years and areas—should be borne in mind in comparing the diagram given on page 163 with the life table diagram. The life-table distribution by age is that of a stationary population showing the mortality rates indicated by the data for the three years covered, while the distribution by age shown in the schedule returns for the year 1910 is that of a population which has been increasing in the past at varying rates, under varying birth and death rates. In its age and sex composition the enumerated population reflects conditions which have obtained throughout a past period of considerable duration. Its composition in 1910 was undoubtedly more or less affected by conditions obtaining in the Civil War and reconstruction periods, and even under the regime of slavery. Considerable discrepancies in one as compared with the other age distribu-

AGE COMPOSITION.

tion are, therefore, entirely consistent with accuracy of schedule. Conclusive evidence of inaccuracy in the schedule age returns is found not in a comparison with the life tables for Negro males and females, but in the fact that these returns themselves develop in tabulation an age composition which in detail is inconsistent with any reasonable assumption regarding mortality and birth rates in the past.

Irregularities in the distribution of the population by single years of age, similar to those which have been noted in the returns for 1910, characterized also the returns for 1900, as may be seen by reference to Table 2.

NUMBER IN EACH AGE PER 100,000 UNDER 1 YEAR.

In addition to the population figures for the two years, 1910 and 1900, Table 2 gives the number of Negro males and females in each year of age per 100,000 under 1 year.

At nearly every year of age the number living per 100,000 under 1 in 1910, exceeded the corresponding figure for 1900. The total Negro population per 100,000 under 1 was 3,893,941 in 1910, and 3,612,937 in 1900, the excess of the 1910 over the 1900 figure being 281,006. There is no reason to believe that any considerable proportion of this difference, if any whatever, is due to a greater proportion of omissions, in

1910 as compared with 1900, in the enumeration of infants. Assuming that the two censuses covered were equally accurate and complete in their returns of age, it seems probable that the increase noted has resulted in part from a decrease in the birth rate, tending to reduce the proportion of children in the population, and in part from a general improvement in mortality, tending to increase the proportion of survivors for each age, and the total population relatively to the number under 1 year of age.

CENTENARIANS.

Of the 3,555 centenarians reported in the total population of all classes at the census of 1910, 2,675, or more than three-fourths, were Negroes, the number of centenarians per 100,000 of all ages being for Negroes 27.2, and for whites 0.9. The proportion of centenarians, which is exceedingly small for all classes, probably is not, in fact, appreciably in any degree greater among Negroes than it is among whites. The proportion shown in the returns is inconsistent with the age distribution of the Negro population itself as indicated in the census life tables for Negroes, in which the proportion of centenarians indicated for a stationary population is 5 per 100,000. The proportion in the enumerated population, which is increasing, would be somewhat lower.

DIAGRAM I.—NEGRO POPULATION CLASSIFIED BY SEX AND SINGLE YEARS OF AGE, WITH EXCESS OF MALES OR FEMALES AT EACH AGE; 1910.

NEGRO POPULATION.

DISTRIBUTION BY QUINQUENNIAL AGE PERIODS: 1910 AND 1900.

Some of the error in the return of ages is avoided by classifications which group the population by age periods. The number of children 1 year of age, erroneously returned as 2 years of age, for example, does not in any way affect the number of children returned as under 5; nor does the number of children 11 and 13, erroneously returned as 10, 12, and 14, in any way affect the number 10 to 14 years of age; or the number 20, returned as 21, affect the number 20 to 24 years of age. The classification by five-year periods is, therefore, more accurate than the classification by single years.

¹ Less than one-tenth of 1 per cent.

Changes in percentage distribution similar to those noted might, obviously, result from causes affecting either the population in the younger or that in the older ages—from a decrease in the birth rate, for example, or from an improvement in mortality affecting the adult population. Since, however, an improvement in mortality may be presumed to affect the population of all ages, and especially very young children, and may even tend to increase for a considerable period, rather than decrease the proportion of children and of young persons, it seems probable that the relative decreases shown in Table 3 for the younger ages are associated with a decrease in the birth rate.

Table 3 summarizes by quinquennial age periods the data shown in Table 2 by single years, and gives the percentage distribution by age periods, and the percentage increases for the population in each age period.

In 1910, as compared with 1900, the proportion of Negro males and females in each of the five quinquennial age periods comprising the population under 25 years of age had decreased. The decrease in the case of children under 5 years of age was from 13.8 per cent in 1900 to 12.9 per cent in 1910; for children 5 to 9, from 13.6 to 12.7 per cent; for children 10 to 14, from 12.4 to 11.8 per cent; and in the two succeeding periods, from 11.1 to 10.8 per cent and 11 to 10.5 per cent, respectively.

INCREASE BY QUINQUENNIAL AGE PERIODS: 1900-1910.

While the Negro population as a whole increased during the period 1900-1910 by 11.2 per cent, the specific rates of increase by quinquennial age periods show a wide range of variation from this average—the percentage increases in the ages under 25 being markedly below, and in the ages 25 to 69 markedly above the average. In the younger age periods the increases range from 3.6 to 8 per cent, and in the age periods embracing the population 25 to 69 years of age, from 12.1 to 33.4 per cent. The specific rates of increase during the decade, 1900-1910, for the several age groups are

of course, implied in the relative percentage distributions by age of the population in 1900 and in 1910.

Making due allowance for improvement in mortality, the rates of increase maintained in the younger ages tend eventually to develop in the older ages. This tendency may be simply illustrated. In Table 3 the population under 5 in 1910 compared with the population under 5 in 1900 develops a percentage increase of 3.9. If as these two population groups advance in age they are subjected to the same rates of mortality at each age, the surviving populations will maintain a constant numerical relationship to one another, one being constantly 3.9 per cent in excess of the other. Under this assumption 3.9 per cent will develop as the decennial increase for the age group 10 to 14 years, in 1920; for the age group 20 to 24 years,

in 1930, and for corresponding older groups at successive censuses. Similarly, the percentage increase of 33.4 shown in Table 3 for the age groups 35 to 39 years, since it is a comparison of survivors to the age 35 to 39 years, among children born in the period 1860-1865, with survivors to the same age among children born in the period 1870-1875, represents the high birth rates of these periods and possibly a relative deficiency of births during the Civil War period, or of survivors among children born in that period, as compared with survivors for the later period.

It will be apparent that the different rates shown for the several age groups indicate a retardation in the rate of growth, and that the rate of decennial growth indicated for the total Negro population by the increases of the lower age groups does not exceed 4 per cent.

AGE COMPOSITION.

AGE DISTRIBUTION AT EACH CENSUS: 1820-1910.

Table 4 gives the distribution of the Negro population by sex and age periods at each census, 1830 to 1910, except that of 1880—and Table 5, the distribution in 1820 in comparison with 1900 and 1910. No tabulation by age for Negroes separate from other colored population was made in the 1880 census, and only a partial classification in the 1890 census.

In Table 4 the various age groupings of the earlier censuses have been introduced, and so far as possible data available in later censuses have been compiled under the earlier age classifications. For 1910 and for 1900 the single-year age groups can be compiled under any of the earlier classifications—under those of 1830 and 1840, for example, showing under 10 years of age, 10 to 23, 24 to 35, 36 to 54, 55 to 99, and 100 years and over. Only the first and last of these classes, however, can be shown for succeeding censuses prior to 1900. The quinquennial age classes for the population under 20 years of age, distinguished in the 1850 classification and generally in the classifications of later censuses, can not be shown for 1840 or 1830.

Since the age classes of the several censuses overlap, the population shown in Table 4 for those classes in combination necessarily overlap also where data are available in full detail. Three complete distributions of the Negro population by age are in fact given in Table 4 for the years 1910 and 1900, the first showing quinquennial age periods for the population under 20 years of age, with the total 20 years and over; the second, ten-year age periods covering all ages; and the third showing the age classes of 1830 and 1840. The detail by five-year periods for the population under 20 years of age and by ten-year periods for the older population is available for 1850, 1860, 1870, 1900, and 1910. For the age period "under 10 years" data are available in each census 1830 to 1910—always excepting 1880. No other of the classes shown in Table 4, however, can be carried back through the several years in an unbroken series. The percentage distributions for each year are based upon the population of known age.

The proportion of the population under 10 years of age has declined in each decade from 34.2 per cent, or a little over one-third, in 1830 to 25.6 per cent, or a little over one-fourth, in 1910. In both years the proportion under 10 was practically the same for males as for females. In this period the proportion of the population 10 to 23 years of age increased slightly—from 30.6 per cent in 1830 to 31.1 per cent in 1910; the proportion 24 to 35 years of age increased from 18.5 to 19.8 per cent; the proportion 36 to 54 years, from 11.9 to 16.5 per cent; and the proportion 55 to 99 years, from 4.6 to 7 per cent.

Comparing 1850 with 1910, the proportion of the Negro population 20 years of age and over increased from 44.2 per cent in 1850 to 51.8 per cent in 1910. In this period the proportion in each of the quinquen-

nial classes comprising the population under 20 years of age decreased—for the age group under 5 years from 16.5 per cent in 1850 to 12.9 per cent in 1910; for the age 5 to 9 years, from 14.8 to 12.7 per cent; for the age 10 to 14 years, from 13.4 to 11.8 per cent; and for the age 15 to 19 years, from 11 to 10.8 per cent.

According to Table 5, which presents the classification of 1820, the proportion of the Negro population under 14 years of age decreased from 43 per cent in 1820 to 35 per cent in 1910; the proportion 14 to 26 years increased from 25.9 to 26 per cent; the proportion 26 to 45 years, from 20.7 to 24.7 per cent; and the proportion 45 and over, from 10.4 to 14.3 per cent.

45 years and over.....	654,191	579,638	89,508	13.3	13.1	10.3

From the figures given in Tables 4 and 5 it would appear that the decrease noted for the decade, 1900-1910, of the proportion in the younger ages, has been fairly continuous throughout a considerable period. Incidentally it may be noted that the changes in age composition, during the entire period for which data are available, indicate for the Negro population a material increase in economic power, in so far as economic power is dependent upon age, since relatively to the total Negro population the proportion in the economically productive ages has constantly increased, while the proportion in the dependent ages of childhood and youth has declined.

SEX DISTRIBUTION BY AGE.

The sex distribution by single years of age of the Negro population as enumerated is extremely irregular and divergent, as compared with the life table

distribution. The discrepancies between the two distributions will be apparent upon reference to the age pyramid diagrams.

According to the enumerated returns, females are in excess in each of the single year ages 13 to 30 years, excepting the age 21, and are generally in the minority in the older ages up to the age of 80. In the life-table population females are in excess at all ages, the excess being greater in the older than it is in the younger ages. The excess of males shown in the enumerated population for the more advanced ages seems, therefore, quite inconsistent with the specific mortality rates of the life table. Some of the enumerated excess of females in the younger ages is probably accounted for by understatement of age by females.

In Table 6 the excess of males or of females in the Negro population, and the number of males per 1,000 females is shown by quinquennial age periods for the years 1910 and 1900, the sex ratio of the native white population in 1910 being introduced for comparison. The 1910 data as regard Negroes are illustrated by Diagram II.

DIAGRAM II.—DEFICIENCY OR EXCESS OF MALES PER 1,000 FEMALES BY AGE PERIODS, IN THE NEGRO POPULATION: 1910.

100 years and over.....	667	781	601	531	738
Age unknown.....	3,112	1,003	1,223	1,064	2,214

It will be apparent from Table 6 that the sex ratio showed a wider range of variation from age group to age group in 1910 than it did in 1900. In both years, however, an excess of females over males is shown for each of the age groups comprising, in the aggregate, the population under 35 years, except for the age 10 to 14, an excess of males for each of the age groups comprising the population 45 to 79 years, and an excess of females in the more advanced ages. In view of the irregularity of the sex distribution of the Negro population by age, this degree of correspondence between 1910 and 1900 is remarkable.

The sex ratios for the native white population indicate an excess of males at each age except 20 to 24 years in the population under 70 years of age and an excess of females in the more advanced ages. The highest ratio for the native white population is that of 1,120 males to 1,000 females in the age 50-54 years, which age group shows the highest ratio also for the Negro population—1,223 males to 1,000 females. Although the native white population shows an excess of males throughout the younger ages, while the Negro population shows for these ages an excess of females, in the middle age periods the excess of males is relatively less in the native white than it is in the Negro population.

100 years and over.....	601	531	530	700	687	1,104	958

¹ Ratio not shown, the number of females being less than 100.

Tables 7 and 8 present the sex ratio for the age classes shown in Tables 4 and 5. At each census for which data are available an excess of males is shown in the age group 10 to 14 years, although in the age groups under 5, under 1, 5 to 9, and 15 to 19, females are generally in excess. This irregularity is undoubtedly accounted for by errors in the returns. At each census females have been generally in excess in the younger ages, males in the late middle life periods, and females in the more advanced ages.

AGE DISTRIBUTION BY RACIAL CLASSES.

The composition of the Negro population in comparison with other racial elements in 1910 is given in Table 9 by sex and by reduced detail of age.

The proportion under 1 year of age, and under 5 years is somewhat smaller in the Negro than it is in the aggregate native white population; the proportion 5 to 14, 15 to 24, and 25 to 44, somewhat larger; and the proportion 45 to 64 and 65 and over, somewhat smaller.

It should be borne in mind that parents of native children are in many cases foreign-born, and that in such cases the classification by nativity separates the children from the parents. Similarly within the native population the children of natives of foreign or of mixed parentage are natives of native parentage, the classification by parentage in these cases, also separating children from parents. The proportion of children in the aggregate native white population, and in the native white population of native parentage, therefore, exceeds the proportion representing natural increase for these classes. The foreign-born white population in 1910 exceeded 13,000,000 and children born of this population during the 5 years preceding the census enumeration are classified as native whites of foreign or mixed parentage. The native white population of foreign or mixed parentage exceeded 13,000,000, and children born of this population in the five years preceding the enumeration, together with the children of native whites of native parentage are classed as natives of native parentage under 5 years of age.

These factors invalidate comparisons by age of the Negro population with the several nativity and parentage white classes. To the extent that Negroes intermarry with whites, however, an effect upon the age

distribution of Negroes results similar to that resulting from the white nativity and parentage classification, since the children of mixed Negro and white parentage are generally classified as Negroes, thus increasing the proportion of children among Negroes.

The Indian population shows a larger proportion under 5 years, under 1, and 5 to 14, than the Negro; a smaller proportion 15 to 44; and a somewhat larger proportion 45 and over.

In each class except the Negroes, males are in excess in the ages under 5, under 1, and 5 to 14 years of age. Among native whites of native parentage males are in excess at all ages shown except in the population 65 and over.

Table 10 gives in comparison the distribution by age of the Negroes, native whites, and foreign-born whites, for the years 1910, 1900, and 1890, and Table 11, the distribution for these classes and years, by cumulative age periods.

In Table 11 it is shown for the age 45 years, for example—similar data being shown for other ages—that the Negro population under 45 years of age increased from 6,454,544 in 1890 to 8,394,496 in 1910; that the Negro population 45 years and older increased from 979,683 in 1890 to 1,402,227 in 1910; that the proportion under 45 in the Negro population of known age decreased slightly during this period—from 86.8 per cent in 1890, to 85.7 per cent in 1910; that the corresponding proportion decreased slightly in the native white population of native parentage—from 82.8 to 81.9 per cent—decreased markedly in the native white population of foreign or mixed parentage—from 95.4 to 87.4 per cent—and increased slightly in the foreign-born white population—from 65 to 65.6 per cent; that in the Negro population, as in each class of the native white population, the proportion under 45 among females exceeded the corresponding proportion among males.

The growth during the last two decades of the Negro population broadly classified by age, as over or under specified ages, is given in Table 12 (p. 172), which shows, for example, that the Negro population under 15 years of age increased in the decade 1900-1910 by 4.4 per cent, as compared with an increase for the population 15 years of age and over of 16.2 per cent. The population under 25 years of age increased 5.4 per cent and the population 25 and over 21.6 per cent. The corresponding percentages for the population under and over the precise age 45 years were 11 and 15. Comparison with the preceding decade is somewhat invalidated by the defective character of the 1890 enumeration, the increases for this decade being generally affected by the under count of Negroes in 1890. The fact that the increase in the younger ages is at a lower rate than it is in the more advanced ages has been commented upon.

1 These figures are estimates. The Negro population under 15 years of age was shown by the 1890 census and was 3,174,769, but the number under 5 and the number from 5 to 14 were not distinguished. This distinction was, however, made for the total colored population, the figures being 1,055,915 and 2,142,367, respectively. Apply to the figures for the Negroes under 15 the same proportions for the two age groups as for the total colored, and the figures and percentages given in the table have been calculated. There is no appreciable error, since the Negroes constitute the great bulk of the colored and also there is no very material difference between the Negroes and the other colored with respect to the distribution of the persons under 15 between the two age groups.

DISTRIBUTION BY CUMULATIVE AGE PERIODS, OF THE NEGRO POPULATION OF KNOWN AGE, AND OF CLASSES OF THE WHITE POPULATION, BY SEX: 1910, 1900, AND 1890.

PERCENTAGE NEGRO BY AGE PERIODS: 1910 AND 1900.

Excepting the very advanced ages, at each of the last two censuses, the proportion Negro in the total population of all classes, was higher in the younger ages than it was in the older. This proportion is shown by quinquennial age periods in Table 13. The relatively low proportions in the adult ages generally, are accounted for principally by immigration of whites in these ages.

AGE PERIOD.	POPULATION.					
	Total.		Negro.

100 years and over.....	7,391	6,268	2,447	2,434	33.1	38.8
Age unknown.....	3,855	3,804	2,675	2,553	75.2	72.9
Age unknown.....	169,055	200,584	31,040	48,811	18.4	24.3

The lowest proportion Negro in 1910 was that of 6.6 per cent for the age period 75 to 79 years. This age period shows the lowest proportion, 7.8 per cent, also in 1900. The highest proportion at each census, except at very advanced ages, was that for the age 5 to 9 years—12.8 per cent in 1910, and 13.6 per cent in 1900. The high proportions in the population 90 years of age and over—17.5 per cent in the population 90 to 94 years, 33.1 per cent in the population 95 to 99 years, and 75.2 per cent in the population 100 years and over are undoubtedly accounted for by errors in the age returns to which attention has already been directed, the tendency to overstate age among very elderly persons being stronger among Negroes than among other classes. This overstatement of age also

diminishes slightly the proportion for certain less advanced age periods.

MEDIAN AGE: 1820-1910.

Table 14 gives the median age of the Negro and of the white populations at each census, 1820 to 1910—except that for the years 1880 and 1890, the data are for the aggregate colored population—with details for white classes in 1910. Table 22 (p. 179) gives the median age of the Negro population in 1910 and in 1900, and of the colored population in 1890 and 1880, by states.

YEAR AND RACIAL CLASS.	MEDIAN AGE IN YEARS.		
	Both sexes.	Male.	Female.

White.....	17.2	17.2	17.3
Negro..... 1820.....	17.2	16.9	17.4
White.....	16.5	16.5	16.6

Since in the earlier censuses age is not shown by single years, the median age, i. e., that age which divides a population or class into two equal groups, the number older being exactly equal to the number younger, can not be so exactly determined, as it can for the last four censuses. In the case of the Negro population at the several censuses 1830 to 1870, inclusive, the determination of the median age involves an estimated distribution of the population 15 to 19 years of age by single years. The margin of error in this distribution, which is based upon the enumerated distribution in 1900, probably does not exceed in its effect upon the median age a variation of a few months. In the estimate for Negroes in 1820, which involves a distribution of the population 14 to 26 years of age, by single years, the margin of error is somewhat greater.

During the decade, 1900-1910, the median age of the Negro population increased from 19.4 to 20.8 years, and in 1910 was exceeded slightly by the median age of the native white population, 21.4 years. In both classes it was slightly higher in 1910 among males than among females—21.1 as compared with 20.6 years among Negroes, and 21.5 as compared with 21.3 years among native whites. In 1820 the median age of the Negro population, 17.2 years, exceeded that of the aggregate white population, 16.5 years, but at each succeeding census the figure for whites has exceeded that for Negroes. The median age for the aggregate white population, it should be noted, is materially affected by the age distribution of the foreign-born whites, a relatively small proportion of whom are in the younger ages. The effect of the inclusion of the foreign born upon the median age of the whites is apparent in the 1910 figures, the difference between the median age of the native whites, 21.4 years, and of the aggregate whites, 24.4 years, being attributable to the foreign born.

It should perhaps be noted that although median age is determined by the age distribution of the population living at the time of the census enumeration, it is not necessarily affected by changes in age distribution from census to census which would affect the average age of the living. So long, for example, as exactly 50 per cent of the Negro population are under 20.8 years of age, the median age will be 20.8 years, whatever changes take place in the age distribution of the population above or below that age. While the advance in the median age from census to census, in the case of Negroes as of whites, is probably occasioned in part by improvement in mortality which has increased the duration of life, it undoubtedly represents in part decline in the birth rate. Improvement in mortality and decline in the birth rate, obviously both tend to raise median age—the one by increasing the number surviving to ages above the median, and the other by reducing the number in the younger ages.

POPULATION OF SECTIONS AND DIVISIONS CLASSIFIED BY AGE.

Tables 15 to 18 summarize the age data for the three sections—the North, the South, and the West—and for the three southern geographic divisions—the South Atlantic, the East South Central, and the West South Central. In Table 39 (pp. 194-196) is given detail by age and sex for each of the nine divisions, and for each state, including northern as well as southern divisions and states.

While some differences as regards age composition might, in the case of the Negroes as of other population classes, develop in these several areas in consequence of conditions affecting birth rates and specific mortality rates, it will be clear that the differences actually shown in the tabulations of the census returns

are to be explained as occasioned principally by migration.

The effect of migration upon age composition in any section or division is more or less apparent in proportion as migrants—representing net gain or loss by migration—are numerous relatively to the population of the given area. The net migration of Negroes into the North and West from the South has accordingly affected age composition more in the North and West than it has in the South, since the great mass of the Negro population is resident in the South, and relatively to population the proportion of migrants among Negroes is much larger for the North and West than it is for the South. The migration, for example, of 5,000 Negroes aged 20 to 24 years, from the South into the West, while it would not materially affect the age composition of the Negro population living in the South, would very materially affect the age composition of the Negro population living in the West, where the proportion for the age group 20 to 24 years would be nearly doubled.

As will appear upon examination of Table 15, some slight depletion of the adult age groups by net migration northward and westward is perceptible in the Negro population of the South, but the effect of this net migration is much more apparent in the age compositions of the North and West. The proportion of children under 5 years of age, for example, was 13.4 per cent in the South, 8.1 per cent in the North, and 6.4 per cent in the West. Similar proportions obtain for the age groups 5 to 9, 10 to 14, and 15 to 19 years. In the South 50.1 per cent, in the North 31.8 per cent, and in the West 25.7 per cent of the Negro population were under 20 years of age. In the case of each of these age groups the proportion shown in the population of the South is slightly above, and the proportion shown in the population of the North and West is markedly below that shown in the Negro population as a whole. In the older ages the proportions for the South are below, and those for the North and West above the average for the country as a whole. The proportion in the age group 35 to 44 years, for example, was 11.1 per cent in the country as a whole, 10.4 per cent in the South, 16.4 per cent in the North, and 19.3 per cent in the West.

Generally in the North and the West, as well as in the South, the proportion of children decreased, and the proportion of adults increased during the decade 1900-1910. Migration during the decade has, therefore, been sufficient to prevent any approach to a normal age distribution in the North and West.

As between the three southern divisions for which data are given in Table 15 the differences in age composition of the Negro population are inconsiderable.

Of the two tables following on page 174, Table 16 gives, for the age periods and areas shown in Table 15, the percentage distribution of Negro males and females in 1910.

In the North and West a larger proportion of females than of males are in each of the age periods under 30 years, but the differences in distribution by age between males and females in the several areas are not marked.

A comparison of the percentage distribution, by age, of Negroes and whites in the several sections and southern divisions is presented in Table 17, the 1910 populations represented by these percentages being given in Table 18 in somewhat greater detail of age.

AGE COMPOSITION.

PERCENTAGE DISTRIBUTION BY BROAD AGE PERIODS OF THE NEGRO POPULATION AND OF CLASSES OF THE WHITE POPULATION, BY SECTIONS AND SOUTHERN DIVISIONS: 1910 AND 1900.

In the South the proportion of children under 5 years of age in the native white population of native parentage exceeded that in the Negro population, the percentages under 5 being 14.6 for native whites of native parentage and 13.4 for Negroes in 1910 and 14.6 and 14.2, respectively, in 1900. At each census the proportion 5 to 14 and 15 to 24 years of age was higher among Negroes than among native whites of native parentage; the proportion 25 to 44 years of age was slightly higher among Negroes in 1910 and among native whites of native parentage in 1900; and at each census the proportion 45 to 64 and 65 and over was smaller among Negroes. The decline during the decade 1900-1910 in the proportion of children under 5, noted in the case of Negroes does not appear in the case of native whites of native parentage in the totals for the South, although it appears in the total for the

West South Central division, and in those for the North and the West. This may be explained in part by the migration of adults in this class of population northward and westward. The age distributions of Negroes and of native whites of native parentage in each of the three southern divisions are, on the whole, remarkable rather for their similarities than for their differences.

It may be noted that the proportions under 5, 5 to 14, and 15 to 24 in the Negro population of the South at each of the last two censuses exceeded the corresponding proportions for the native white population of native parentage in the North and West. This is remarkable because of the large number of native whites of foreign or mixed parentage in the North and West, whose children are natives of native parentage.

NEGRO POPULATION.

The percentage Negro in the population classified by age periods is given for sections and Southern divisions in Table 19 for 1910 and 1900.

Single years of age for ages under 25 years are shown by sex in Table 20, for the Negro population of the several sections and southern divisions in 1910.

The irregularities in distribution by single years of age, which have been noted in the totals for the Negro population as a whole, appear in the figures for each section and division shown in Table 20. In each

Southern division the number under 1 year of age is, relatively to the numbers 2, 3, and 4 years of age, so small as to indicate omissions in the enumeration of infants; in each area for both males and females fewer children were reported 1 year of age than were reported for each of the ages 2 years, 3 years, and 4 years—with the inconsiderable exception in the West, that fewer females were reported for the age 2 years than for the age 1 year; and in each area concentrations are in evidence upon even years of age.

NEGRO POPULATION.

POPULATION OF STATES CLASSIFIED BY AGE.

Variations in age composition from state to state, as is true of variations from one section or division to another, are principally effects of migration. The age compositions of the relatively small Negro populations of the several Northern and Western states are fairly represented in the totals for the North and the West, and need not be further considered in detail. In each of these states the proportion in the adult ages is increased and the proportion of children diminished by the accession of immigrants.

The percentage distribution by age, of the Negro population and of classes of the white population in 1910 and in 1900 is shown for Southern states in Table 21. In these states—exclusive of the District of Columbia—the proportion under 5 years of age ranged in 1910 from 9.8 per cent in Kentucky to 15.4 per cent in the Carolinas, North and South. The proportion in this age group was low in the border states of Delaware, Maryland, West Virginia, and Kentucky; and high in the contiguous black-belt states of North Carolina,

South Carolina, Georgia, Alabama, and Mississippi. In each of the Southern states the proportion of children under 5, and 5 to 14 years of age, declined during the decade, 1900-1910; in each of these states except Louisiana and Texas, the proportion of the population 15 to 24 declined in the same period; in each state, the proportion 25 to 44 increased; and in each state except North Carolina, South Carolina, and Louisiana the proportion 45 to 64 increased. In 6 states the proportion 65 and over increased, in 4 states and in the District of Columbia it remained unchanged, and in 6 it decreased. The changes are in many instances slight, but are in the case of the population of each state generally consistent with those changes which have been noted in the age composition of the Negro population as a whole, since in each state, as in the country as a whole, the proportion in the younger ages has declined, and the proportion in the middle life ages has increased. This general tendency is of course variously affected in the several states by interstate migration.

PERCENTAGE DISTRIBUTION, BY BROAD AGE PERIODS, OF THE NEGRO POPULATION AND OF CLASSES OF THE WHITE POPULATION, BY SOUTHERN STATES: 1910 AND 1900.

¹ Less than one-tenth of 1 per cent.

NEGRO POPULATION.

In Table 22 the states have been listed in order according to the median age of the Negro population, at the censuses of 1910 and 1900, and according to median age of the colored population at the censuses of 1890 and 1880, states having a Negro or colored population of less than 1,000 being omitted.

For the Southern states generally, with the exception of Oklahoma, the data for the aggregate colored population in 1890 and in 1880 may be accepted as fairly comparable with the data for Negroes in 1900 and in 1910, since in these states the colored population other than Negro is relatively too small materially to affect the state figures. In some of the Northern and Western states, however, the colored other than Negro are relatively to the Negro so numerous as to impair the comparability of the figures.

It will be noted that the states in which the median age is low are those in which the proportion of children

is large. The five states showing the lowest median age in 1910, for example—South Carolina, North Carolina, Georgia, Mississippi, and Alabama—are the five contiguous black-belt states in which, as has been remarked, the proportion of children under 5 exceeded the corresponding proportion in any other of the Southern states.

In each of the 16 Southern states in 1910 the median age of the Negro population was lower and the proportion of children higher than it was in any of the Northern or Western states. The range of median age for the Southern states was from 17.5 years in South Carolina to 24.2 years in Kentucky; and for the Northern states, from 26.1 years in Kansas to 33.1 years in Oregon. The states showing a high median age are those in which the proportion of migrants is high.

MEDIAN AGE, BY STATES, OF THE NEGRO POPULATION: 1910 AND 1900—AND OF THE NEGRO, INDIAN, AND MONGOLIAN POPULATION: 1890 AND 1880.

Table 22	Median age of Negro population: 1910.	STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN 1900.	Median age of Negro population: 1900.	STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN 1890. ¹	Median age of Negro, Indian, and Mongolian population: 1890.	STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN 1880. ²	Median age of Negro, Indian, and Mongolian population: 1880.

¹ Includes population of Indian Territory for 1900.

² Except Indian Territory, the population of which was not returned by age.

¹ Except Indian Territory, the population of which was not enumerated.

Table 37 gives for sections, southern divisions, and Southern states, the Negro population classified by age periods, in 1910 and in 1900; Table 38, for South-

ern states the Negro population under 25 years classified by sex and single years of age; and Table 39, for the nine geographic divisions, and for all states, in-

AGE COMPOSITION.

cluding the Northern and Western, the Negro population classified by sex and by quinquennial age periods. These tables present actual numbers only, and no analysis of them is undertaken, beyond that which is found in the preceding summary and derivative tables of this chapter.

URBAN AND RURAL POPULATION CLASSIFIED BY AGE.

The age distribution of the urban population and of the rural population in 1910 is given in Table 23 for the Negro population and for the nativity and parentage classes of the white population.

As has been explained elsewhere the urban aggregate embraces the population of all towns and cities of 2,500 inhabitants or more; the rural, the population of smaller cities and towns, together with that of country districts. One of these aggregates is constantly receiving accessions from the other in consequence of the constant drift of population into the cities. This drift cityward, in response to the gravity pull of the urban community, naturally affects principally the population in the middle ages, since the population in the younger ages is dependent and incapable of moving freely, while the population in the older ages is more settled, less venturesome, and less capable of fulfilling the requirements of urban conditions.

In the age distributions of Table 23 it is apparent that a much larger proportion of the urban than of the rural Negro population are in the economically productive ages of middle life. The Negro population of urban communities in 1910 numbered 2,689,229, and of rural communities 7,138,534. Of the urban 36.6 per cent were in the ages 25 to 44 years, and of the

rural 23.2 per cent. For this age group the proportion had been raised in the urban population above, and depressed in the rural population below, the average of 26.8 per cent in the Negro population as a whole.

Upon comparison of the percentages given in Table 16 (p. 174) for the Negro population as a whole, with those given in Table 23 for the urban and rural aggregates, it will be seen that the age distribution of the urban population is more abnormal than that of the rural. This is accounted for by the fact that, since the aggregate urban population is smaller than the aggregate rural, migrants moving into urban communities constitute a larger proportion of the urban than of the rural population, and consequently affect the age composition more in the urban than in the rural aggregate.

Of the urban Negro population 8.5 per cent were under 5 years of age, and of the rural 14.5 per cent, the proportion for the Negro population as a whole, urban and rural combined, being 12.9 per cent. It is probable that a higher rate of natural increase and a lower rate of infant mortality obtains in rural than in urban communities, and that the lower proportion of children in the urban population is in part the effect of a relatively low birth rate combined with a relatively high rate of infant mortality. Undoubtedly, however, as regards age composition, the differences between urban and rural populations, as between different sections of the country, originate principally in migration. By depleting the adult ages of the rural population migration cityward raises the proportion of children in the rural aggregate, and by adding to the adult ages of the urban population depresses the proportion of children in the urban aggregate.

Among native whites of native parentage, as among Negroes, the proportion of children under 5, and 5 to 14 years of age was smaller in the urban than in the rural population. Among native whites of foreign or mixed parentage the proportion of children under 5 was larger, and the proportion 5 to 14 slightly smaller in the urban population; and among the foreign-born whites the proportion in each age group was slightly larger in the urban population. It should

perhaps be remarked that these figures do not indicate any tendency on the part of the foreign white stock to have more children in urban than in rural communities. The high proportion of children in the urban white population of foreign or mixed parentage, is accounted for by the presence in urban communities of a relatively large foreign-born population, whose children born in this country are natives of foreign or mixed parentage. In the case of the foreign born, the

AGE COMPOSITION.

proportion of children relates to children born in foreign countries, and has, therefore, no significance whatever as regards natural increase of urban and rural populations. In the case of the native whites of native parentage also, comparisons with Negroes, embracing the country as a whole, are similarly invalidated by the parentage classification. Approximately two-thirds—65.3 per cent—of the native whites of foreign or mixed parentage and only a little over one-third—36.1 per cent—of the native whites of native parentage were in urban communities in 1910. Since children of native whites of foreign or mixed parentage are natives of native parentage, the proportion of children among natives of native parentage is raised in both the urban and the rural population above the proportion representing natural increase, and is raised more for the urban than for the rural population, because native whites of foreign or mixed parentage are relatively to native whites of native parentage much more numerous in urban than in rural communities.

Table 24 shows, for sections and southern divisions, the distribution by age and sex of the Negro urban

and rural population in 1910. In the urban population the deficiency of children, and the concentration in the ages 25 to 44 years is more marked in the North and West than it is in the South. Of the males living in urban communities in the South 9.5 per cent were under 5 years of age, in the North 7.5 per cent, and in the West 5.9 per cent, the corresponding figures for females being 8.5, 7.6, and 7 per cent. The proportions for the age group 25 to 44 years in the urban Negro population, were for males 34.5 per cent in the South, 43.2 per cent in the North, and 46.9 per cent in the West; for females, 34.2, 40.3, and 43 per cent, respectively.

The rural Negro population of the North and West, as well as the urban has been largely recruited by migrants from the South. It presents, therefore, an age composition similar to that of the urban population, although the deficiency of children, and the concentration in the adult middle ages in the rural population of the North and West is generally less marked than in the urban population.

PERCENTAGE DISTRIBUTION BY AGE PERIODS OF THE URBAN AND RURAL NEGRO AND WHITE POPULATION, BY SECTIONS AND SOUTHERN DIVISIONS: 1910.

¹ Includes persons of unknown age.

NEGRO POPULATION.

Comparison of age composition in the urban and rural population is made in Table 25 by racial classes, for the several sections and southern divisions.

In connection with Table 25 it is to be remarked that the native white population of foreign or mixed parentage is, relatively to the native white population of native parentage, much smaller in the South than it is in the North and West, and that consequently the proportion of children among native whites of native parentage is much less affected in the South than it is in the North and West, by the inclusion of children of foreign origin. Obviously the high proportion of children in the urban native white population of foreign or mixed parentage in the North—i. e., 15.6 per cent, which exceeds the rural percentage of 12.3 for the same class—is explained by the fact that the foreign-born population is largely resident in urban communities of the North.

In the urban population the proportion under 5 years of age in 1910 was higher, and the proportion 25 to 44 years of age lower, among native whites of native parentage, than among Negroes, in each section and southern division. These and other differences between the several classes, as regards age composition of the urban and rural elements, arise from

differences in the rates of natality and mortality, differences in the proportion of migrants, and differences in the distribution of the white population by nativity and parentage.

Statistics for Southern states are given in Table 40 similar to those given in Table 25 for sections and southern divisions. The urban and rural Negro population classified by age periods is given for all states in Table 41.

Since the drift from country to city affects principally the adult ages—and probably also, in part because the birth rate is generally higher, and the infant mortality lower, in rural than in urban communities—the percentage urban is generally higher for the adult population than it is in the population under 5, and 5 to 14 years of age.

In the Negro population the percentage urban increases from 18.1 for the age under 5 years to 37.4 for the age 25 to 44 years, and decreases to 26.3 for the age 65 years and over. In the native white population, also, the maximum percentage urban, 48.2, is for the age 25 to 44 years, and in this class, as among Negroes, the percentage falls off for the more advanced ages.

The percentage urban is given by age periods and sex, for Negroes and native whites, in Table 26.

In the South the percentage urban among Negroes ranges from 14.2 in the population under 5 years of age to 28.7 in the population 25 to 44 years, the corresponding figures for the native whites being in the population under 5 years, 17.2 per cent, and in the population 25 to 44 years, 27.2 per cent. In the North and West the percentage urban is exceedingly high at all ages among Negroes, ranging in the North from 65.7 per cent in the population 65 years and over to 83.2 per cent, or approximately five-sixths in the population 25 to 44 years; and in the West, from 71.9 per cent in the population 65 years and over to 79.9 in the population 25 to 44 years. At every age the Negro population is predominantly rural in the South and predominantly urban in the North and West. This is true of both males and females.

The excess of males or females in the urban and rural Negro population, classified by age, is shown in Table 27 for the South, the North, and the West.

At each age in each geographic section the proportion of males was higher in the rural than it was in the urban population. In the adult rural Negro population of the West males outnumbered females by more than 2 to 1—the number of males per 1,000 females being 2,012 for the age 15 to 24 years, 2,197 for the age 25 to 44 years, and 2,199 for the age 45 to 64. For the southern rural Negro population the highest ratio is that of 1,249 males to 1,000 females in the age 45 to 64 years.

In the adult Negro population, both urban and rural, the proportion of males was generally higher in the North and West than it was in the South.

Females outnumbered males in 1910 in all ages in the urban Negro population of the South, the greatest disparity between the sexes being for the age period 15 to 24 years. In this age period the excess of females over males amounted to 56,870, the sex ratio being 760 males to 1,000 females. In the urban Negro population of the North and West females were in excess in the ages under 25 years and males in the ages 25 to 65 years.

The sex ratios of Table 27, for the Negro urban and rural population as a whole, indicate that the migration cityward of females generally exceeds that of males, since at all ages the proportion of males is relatively lower in the urban than in the rural population. Differences between the mortality rates of males and females living in urban and in rural communities may, however, affect the ratios for certain ages.

As regards any given section of the country, obviously the sex ratios of the urban and rural population in the adult ages may be entirely independent of one another. The high proportion of males in the rural population of the West, for example, does not imply a low proportion in urban communities of this or of any other section, since the ratios may be largely determined by migration from urban or rural communities of other sections. In the country as a whole, however, differences in the sex ratios between urban and rural communities must originate principally in the net drift of the population into urban communities.

The percentage Negro in the urban and rural population, classified by age, is shown by sections in Table 28.

At each age Negroes constituted in 1910 a larger proportion of the aggregate rural population of the country than they did of the aggregate urban, the percentage Negro ranging in the rural population from 9.6 to 17, and in the urban from 4.6 to 7. This higher proportion in the rural is explained by the fact that since the Negro population is largely resident in the South, which is predominantly rural, the proportion rural in the Negro population as a whole exceeds the proportion rural in the white population as a whole.

NEGRO POPULATION.

No such marked difference between the urban and the rural percentage Negro is observable in the figures for the several sections as appears in the aggregate for the country as a whole. In the North and West the percentage Negro is, in fact, higher in the urban population, and in the South it is not very materially higher in the rural than it is in the urban population

Obviously the percentage Negro in the population at different ages in urban and rural communities is affected by migratory shiftings of the white, as well as of the Negro population.

In the South the proportion Negro in the population 25 to 44 years of age was practically the same in the urban as in the rural population—29.4 per cent in

the urban and 29.3 per cent in the rural. In the younger, and in the more advanced ages the proportion Negro was higher in the rural population than it was in the urban. The highest proportion Negro is that of 32.1 per cent, for the rural population 5 to 14 years of age in the South. The highest proportions in the urban population are for the age 15 to 24 years 29.9 per cent, and 25 to 44 years, 29.4 per cent.

In the North and West at all ages the proportion Negro was higher in the urban than in the rural population, the maximum percentage being that of 3.1 for the age period 25 to 44 years in the North.

POPULATION OF CLASSES OF CITIES CLASSIFIED BY AGE.

In Table 29 the age distribution of the urban Negro population is shown for classes of cities. The proportions under 5, 5 to 14, and 15 to 24 years of age in 1910 were smallest in the aggregate for the 8 cities of 500,000 inhabitants or more, increased from class to class in the aggregates for the 42 cities of 100,000 to 500,000, for the 179 cities of 25,000 to 100,000 and for the 2,173 cities of 2,500 to 25,000 inhabitants. The proportion in the age group 25 to 44 years was largest in the aggregate for cities of 500,000 or more and decreased from class to class. For cities of 500,000 or more the proportion under 5 years of age was 7.3 per cent, and the proportion 25 to 44 years, 45 per cent, the corresponding proportions for cities of 2,500 to 25,000 being 9.7 and 31.6 per cent.

Similar variations in age composition from one urban class to another are observable in the statistics for the South separately, and for the North, the variations shown for the relatively small urban Negro population of the West being less regular.

Conditions obtaining in small urban communities undoubtedly approach nearly to conditions obtaining in rural towns and villages, but the aggregate rural, including the scattered population of country districts, develops considerable differences in comparison with the class of small cities.

In Table 30 statistics of age composition are given for the Negro population living in cities of less than 25,000 inhabitants and in rural districts, in cities of 25,000 to 100,000, and in cities of 100,000 and over. For these three classes data are available for 1900, and a comparison of 1910 with 1900 is made in Table 30. For each of these classes in the country as a whole, and in the South and the North, the proportion under 5, 5 to 14, and 15 to 24 years of age was smaller in 1910 than in 1900, and for each class the proportion 25 to 44 years was larger.

AGE COMPOSITION.

CLASSIFICATION BY AGE PERIODS OF THE NEGRO POPULATION LIVING IN URBAN AND RURAL COMMUNITIES,
AND IN CLASSES OF CITIES, BY SECTIONS: 1910.

AGE PERIOD.	NEGRO POPULATION: 1910.

POPULATION OF INDIVIDUAL CITIES CLASSIFIED BY AGE.

Statistics for individual cities are given in Tables 43, 44, and 45 (pp. 201 to 206). Table 43 gives the number of Negro males and females classified by quinquennial age periods for the 50 cities having a total population—white and colored—of 100,000 or more in 1910; Table 44, in less detail by age, statistics for the 68 cities of 25,000 to 100,000, having in 1910 a Negro population of 1,000 or more; and Table 45 by still broader age periods, statistics for the 88 cities of 10,000 to 25,000, having in 1910 a Negro population of 1,000 or more.

Among these cities Washington, D. C., reported in 1910 the largest Negro population (94,446), New York City the second largest (91,709), and New Orleans the third largest (89,262). The Negro populations of New York City and New Orleans were approximately equal, and a comparison of the age distributions of the

Negro populations of these two cities, one a typical northern and one a typical southern city, is made in Table 31.

While the age distributions of the Negro population in these two cities are similar, the deficiency of children under 5, and the concentration in the ages 25 to 44 years are more considerable in New York City, among both males and females. The percentage increases of the several age groups during the decade, 1900-1910, show a wide range of variation. In New Orleans although the number of children under 5 increased 6.1 per cent, the number 5 to 14 decreased 2 per cent. For the age group 15 to 24, the increase was 16.7 per cent; for the age group 25 to 44, 30 per cent, and in the succeeding age groups 7.6 and 9.6 per cent. For each age period the percentage increase was much higher in New York City, in which the Negro population under 5 years increased 46.2 per cent; 5 to

AGE COMPOSITION.

14 years, 34.1 per cent; 15 to 24 years, 28.2 per cent; 25 to 44 years, 72.3 per cent, and in succeeding age groups 42.9 and 47.9 per cent. In view of the low rate of increase of children under 5 in New Orleans (6.1 per cent) the relatively high rate (20 per cent) shown for children under 1 seems improbable, and may indicate inaccuracies or omissions in the returns of infants at the census of 1900.

In general the individual cities for which age statistics are given in Tables 43, 44, and 45, show the characteristics as regards age composition that have been noted in the urban population, and in classes of urban communities.

The Negro population 21 years of age and over in 1910 numbered 4,886,615, or 49.7 per cent of the total Negro population. For this class of the population, as for native whites, the age 21 years is very close to the median age, which divides the class into two equal groups—the median age being for the Negroes 20.8 years, and for the native whites 21.4 years. The proportion 21 and over in the aggregate white population—50.8 per cent in 1910—is raised above the proportion for the native whites by the high proportion (87.3 per cent) among the foreign-born whites.

NEGRO POPULATION.

In the North and West, the proportion 21 and over in the Negro population is very much higher than it is in the South, the proportion being, in 1910, 47.7 per cent in the South, 66.2 per cent in the North, and 72.6 per cent in the West. In each section and southern division the proportion is higher for males than for females.

The number of males per 1,000 females in the Negro and white population 21 years of age and over is shown in Table 33 for sections and southern divisions.

Table 33 MALES TO 1,000 FEMALES IN THE POPULATION 21 YEARS OF AGE AND OVER, 1910.

SECTION AND DIVISION.	MALES TO 1,000 FEMALES IN THE POPULATION 21 YEARS OF AGE AND OVER, 1910.				
	All classes.	Negro.	Whites.		
			Total.	Native.	Foreign born.

The West.....	1,462	1,334	1,418	1,266	1,899

In the population 21 and over, the number of males exceeds the number of females among Negroes and among native and foreign-born whites, but the excess is greater among native whites than it is among Negroes and very much greater among foreign-born whites than it is among native whites or Negroes.

In the South as a whole, however, the excess of males in the Negro population 21 and over is very slight, the number of males to 1,000 females in 1910 being for this section 1,002. In two southern divisions there was, in fact, excess of females, the number of males to 1,000 females being in the South At-

lantic division 985, and in the East South Central, 995. The corresponding figure for the West South Central division was 1,045; for the North as a whole, 1,068, and for the West 1,334.

The percentage Negro in the total population 21 years of age and over classified by sex is given in Table 34 for sections and southern divisions, covering the two years 1910 and 1900. Corresponding data for males is shown in Table 35 for all divisions and states.

Table 34 PERCENTAGE NEGRO IN THE POPULATION 21 YEARS OF AGE AND OVER.

The West.....	0.9	0.9	0.8	0.9	0.9	0.9

In 1910 the proportion Negro in the total population 21 and over was 9.5 per cent, or somewhat less than one-tenth. The proportion among males was 9.1 per cent, and among females 9.9 per cent. In each of the three southern divisions, it was much higher, being 22.5 per cent in the West South Central division, 31.2 per cent in the East South Central, and 31.7 per cent in the South Atlantic. While nearly one-third of the population 21 and over in the South Atlantic and East South Central divisions was Negro, the corresponding proportion for the North was only 2.9 per cent, and for the West 0.9 per cent.

During the decade, 1900-1910, the proportion Negro in the total population 21 and over declined from 10.1 per cent to 9.5 per cent. The decline in the

South as a whole was from 30.9 per cent in 1900 to 28.8 per cent in 1910. In each southern division and in the North, also, the proportion fell off during this

decade. Among males, as shown in Table 35, the proportion declined in each Southern state, excepting West Virginia, Arkansas, and Oklahoma.

Negroes constitute a larger proportion of the rural than of the urban male population 21 and over in the country as a whole, and in each southern division, the percentage Negro in the male population of this age being 12.1 per cent in the aggregate rural, and 6.1 per cent in the aggregate urban population. (See Table 42). In the northern and western divisions the percentage Negro for this age class was higher in urban than in rural communities. In 8 Southern states it was higher in the rural than it was in the urban, and in 8 states it was higher in the urban. For the rural population in the Southern states the percentage ranged from 6.5 per cent in West Virginia to 56.5 per cent in Mississippi; and in the urban population from 7.4 in West Virginia to 43.3 per cent in Mississippi. The maximum

percentage for the urban populations of states—that of 43.3 for Mississippi—is exceeded by the percentage for the rural population in South Carolina, Georgia, Mississippi, and Louisiana.

MALES OF MILITIA AGE.

Table 36 shows by sections and southern divisions the number of males 18 to 44 years of age, in the Negro and white population. Statistics for states are given in Table 42.

Of the Negro males in 1910, 1,985,415, or 40.6 per cent of all Negro males were 18 to 44 years of age, the proportion being somewhat lower in the South and higher in the North and West. These Negro males constituted 9.7 per cent of the total male population 18 to 44 years of age. In the South the proportion Negro in the male population of militia age was 28.9 per cent, in the North 2.2 per cent, and in the West 0.9.

CHAPTER XI.—COLOR—BLACK AND MULATTO ELEMENTS.

SIGNIFICANCE OF THE TERMS "BLACK" AND "MULATTO."

The classification of the Negro population as "black" and "mulatto" does not correspond accurately to any physiological characteristic, although it is a classification which measures with some uncertain degree of accuracy the admixture of white blood in the population classified as Negro. Increase in the proportion mulatto in the Negro population may, however, obviously result, and undoubtedly has in the past largely resulted, from the marriage of mulattoes to blacks, as well as from mixed marriages of Negroes and whites.

Of the Negro race one-fifth were returned as mulattoes at the 1910 census; that is, as not being "evidently full-blooded Negroes," as the instructions to the enumerators read, but having, in the judgment of the enumerator, "some proportion or perceptible trace of Negro blood."

Under a condition of complete segregation of the races this proportion not "evidently full-blooded Negro" must inevitably increase, unless the fact that the children of mixed black and mulatto marriages are not "full-blooded Negroes" becomes imperceptible in the case of at least one-half of such children, assuming a uniform natural increase for the black and mulatto elements of the Negro population.

The perceptibility of a trace of Negro or of white blood probably does not correspond uniformly to the physiological proportion of Negro and white blood in the individuals enumerated. Moreover, perceptibility is dependent upon the ability of the enumerator to perceive, and this ability varies from enumerator to enumerator.

There are undoubtedly many individuals in the United States in whom the trace of white blood has become absolutely imperceptible, and many other individuals in whom the trace, although perceptible, is not in fact perceived by the enumerator. Similarly the trace of Negro blood may have become imperceptible, or be unperceived in individual cases.

The census classification is necessarily based upon perceptibility, qualified by the ability of the enumerator to perceive.

At the census of 1910 enumerators were instructed to indicate the color or race of each person enumerated, distinguishing blacks and mulattoes in the Negro population in accordance with the definition following:

For census purposes the term "black" includes all persons who are evidently full-blooded Negroes, while the term "mulatto" includes all other persons having some proportion or perceptible trace of Negro blood.

Substantially similar instructions were given to enumerators in 1870, the term mulatto being defined in 1870 to include "quadroons, octoroons, and all persons having any perceptible trace of African blood." Instructions at the census of 1890, however, differed materially from those of 1910 and 1870. In 1890 the term "black" was defined to include all persons "having three-fourths or more 'black blood,'" other persons with any proportion of "black" blood being classified as "mulattoes," "quadroons," or "octoroons." This classification was made under the following instructions to enumerators:

Be particularly careful to distinguish between blacks, mulattoes, quadroons, and octoroons. The word "black" should be used to describe those persons who have three-fourths or more black blood; "mulatto," those persons who have three-eighths to five-eighths black blood; "quadron," those persons who have one-fourth black blood; and "octoroon," those persons who have one-eighth or any trace of black blood.¹

At the censuses of 1850 and 1860 the terms "black" and "mulatto" appear not to have been defined. In 1850 enumerators were instructed simply in enumerating colored persons to write "B" or "M" in the space on the schedule, to indicate black or mulatto, leaving the space blank in the case of whites. In 1860 no instructions are known to have been given to enumerators. No data are available in published reports for the census years 1880 and 1900.

It will be noted that the classification of 1890 provides by implication for a finer distinction in the case of individuals with a comparatively small proportion than it does in the case of individuals with a large proportion of Negro blood. The enumerator was instructed to distinguish persons having one-eighth from persons having one-fourth or two-eighths Negro blood; persons having one-fourth from persons having three to five eighths; and these persons from those having three-fourths or more.

If the exact proportion of Negro and white blood could be accurately determined by the enumerator in each individual case these fractions—one-eighth, one-fourth, three to five eighths, and three-fourths or more would obviously not provide for the classification of the Negro population, since there is no reason to suppose that the number of persons having two, or

¹ Regarding the classification of the Negro population of mixed blood in 1890, as mulattoes, quadroons, and octoroons, the following statement is made in the report of the Eleventh Census: "These figures are of little value. Indeed, as an indication of the extent to which the races have mingled, they are misleading." (Census of 1890, Population, Part I, p. xciii.) The aggregate number in the several classes as returned in 1890 was as follows: Blacks, 6,337,980; mulattoes, 956,989; quadroons, 105,135; octoroons, 69,936.

four sixteenths—that is, octoroons or quadroons in the literal sense of these terms—are more numerous than persons having three or five sixteenths. Under the 1890 definitions the class mulatto included persons having from three to five eighths Negro blood, and by implication persons having more than five-eighths—rather than more than three-fourths—were to be classified as blacks. Persons having between one-fourth and one-half Negro blood were divided between mulattoes and quadroons. Consistently with this principle of classification persons having between one-eighth and two-eighths of Negro blood must, it would seem, have been divided by the enumerators—although without specific instructions—between quadroons and octoroons. The extensions indicated in instructions to enumerators make the 1890 classes represent the following proportions: Black, ten-sixteenths or more; mulatto, six to ten sixteenths; quadroons, three to six sixteenths; and octoroons, less than three-sixteenths.

The fractions noted indicate class limits, within which every gradation of intermixture is comprehended, the exact proportion of intermixture in the great majority of cases being in all probability a proportion which can not be accurately stated by any fraction with a small denominator, and ranging by minute gradation, in the aggregate, from an imperceptible trace of white to an imperceptible trace of Negro blood. The provision in the 1890 census law, that "the population schedule shall include an inquiry as to the number of Negroes, mulattoes, quadroons, and octoroons," implies that these classes as distinct classes compose in the aggregate the Negro population, which obviously is not the case, if by octoroon, for example, one means a person in whom the proportion of Negro blood is precisely one-eighth.¹

¹ The fine gradations of admixture of white blood in the Negro population may be simply illustrated. If, for example, six individuals, in which the proportions of Negro blood are respectively precisely one-sixteenth, one-eighth, two-eighths, four-eighths, six-eighths, and eight-eighths, be presumed to intermarry, the number of possible different proportions in their children are 14; and if the group be presumed to be segregated for several generations, the possible different proportions in their great-grandchildren would be represented by approximately 70 fractions having 128 as a denominator and numbers ranging between 17 to 100 as numerators. If the proportions of Negro blood in the original parents were not precisely represented by the fractions given above—as would almost certainly be the case in any group of individuals selected from the Negro population of mixed blood—the number of possible different proportions in the children of third generation would be much greater. Under the assumption made, of complete segregation, the extreme range of differences in the proportion of Negro blood would tend to become less from generation to generation, but the number of different proportions, owing to the finer gradation, would tend to increase indefinitely. The tendency would be for the group collectively to approach a uniform proportion, from which individual proportions would vary by gradations becoming increasingly minute and various. In the hypothetical group supposed above, this limiting uniform proportion would slightly exceed seven-sixteenths Negro. In the mulatto population of the United States as a whole the number of proportions of intermixture is exceedingly great, and there is no reason to suppose that these proportions are concentrated in any considerable degree upon such simple fractions as one-eighth, or one-quarter, or one-half. In the Negro population at the present time, it is not mathematically improbable that any given union of a mulatto with either a black or a mulatto, will in its offspring represent a unique proportion of admixture of white blood.

No attempt has been made at any census, except that of 1890, to secure a return classifying the Negro population of mixed blood according to the proportions of Negro blood. At other censuses the general principle of classification has been to return Negroes showing perceptible traces of white blood as mulattoes, and all others as black. To the extent that the white strain is perceptible in individuals three-fourths (or more than five-eighths) black, they would under the 1910 instructions to enumerators be classified as mulattoes, while under the 1890 instructions they would be classified as black. Some of the increase in the proportion mulatto shown by the census returns—from 15.2 per cent in 1890 to 20.9 per cent in 1910—may, therefore, be a consequence of differences in the instructions to enumerators.

PROPORTION MULATTO: 1850-1910.

In the period of 60 years, 1850 to 1910, the proportion mulatto in the Negro population increased, as is shown in Table 1, from 11.2 to 20.9 per cent, the number of mulattoes per 1,000 blacks being 126 in 1850, and 264 in 1910.

YEAR.	Total.	Black. ¹	Mulatto. ¹		Mulattoes to 1,000 blacks.
			Number.	Per cent.	
1910.....	9,827,763	7,777,077	2,050,686	20.9	264
1900.....	8,833,994	7,488,576	1,345,418	18.2	179

1870.....	4,899,009	4,411,820	487,189	13.2	153
1850.....	3,638,808	3,233,057	405,751	11.2	126

¹ No data for 1880 or 1900.

² Includes 18,636 Negroes enumerated in Indian Territory, not distinguished as black or mulatto.

In comparing the proportion mulatto at the several censuses for which data are available, allowance must be made for the differences noted above in instructions to enumerators, and also for inaccuracy in the returns. The very considerable increase in the proportion mulatto shown for the entire period, 1850-1910, makes a decrease for any decade in this period, such as is shown for the decade, 1860-1870, highly improbable, and it is to be noted that this decrease developed in the returns of a census—that of 1870—which was admittedly very defective as regards the Negro population. It may be fairly assumed that the change in the proportion mulatto has not been interrupted or reversed in any decade.

In the 20 years, 1850-1870, the percentage mulatto increased from 11.2 to 12, or by 0.8; in the succeeding period of 20 years, 1870-1890, it increased from 12 to 15.2, or by 3.2; and in the 20 years 1890-1910, from 15.2 to 20.9, or by 5.7.

It is not improbable that the increase in the proportion mulatto has, in fact, become as is indicated by the census returns, more rapid from period to period. This might naturally result—even without

any continuous infusion of white blood—from the intermarriage of mulattoes with blacks, since the children of such marriages will be mulattoes, under the 1910 definition of the term, provided they show perceptible traces of white blood. The mulatto element increases naturally by the union of mulattoes with mulattoes, of mulattoes with blacks, and of Negroes with whites, while the black increase is largely restricted to the union of blacks with blacks.

In the dissemination of white blood it is conceivable that a stage will be reached at some period in the future where the absorption of the mulatto by the black element in consequence of the white strain becoming imperceptible will equal or even exceed the absorption of the black by the mulatto element—a stage, that is to say, where the trace of white blood will become imperceptible to the census enumerator in the case of at least one-half of the children of mixed mulatto and black parentage. But whatever proportion mulatto future censuses may show for the Negro population, it is inevitable that the dissemination of white blood within the Negro population shall continue to embrace from period to period a larger proportion of that population, until in fact the entire Negro population is affected.

As this gradual modification of the racial character progresses the black element in the population must decrease, and tend to disappear. Under these conditions the standard of classification as black and mulatto may change, the term mulatto being defined with reference not to a pure-blooded Negro, but with reference to a Negro somewhat affected by the general diffusion of white blood.

It is probably true that a much greater proportion than 20.9 per cent of the Negro population in 1910 were of mixed parentage. The proportion more or less affected by the dissemination has been estimated as high as three-fourths, and although no adequate data are available to substantiate such an estimate, the estimate is not in itself improbable. This would mean that in the gradual modification of the Negro population, traces of white blood have already become imperceptible to the census enumerator in approximately one-half of that population, the imperceptibility being probably due in part to a modification of the standard of discrimination, by accepting as the racial type of unmixed descent that type which represents, not the one-quarter of the population which is in fact pure blooded, but the one-half which is slightly modified by the general dissemination of white blood. A progressive modification of the standard of discrimination might obviously prevent the proportion mulatto from increasing, or even occasion it to decline under a condition of complete segregation of the races as the race develops uniformity of type.

In 1850 the proportion mulatto in the free colored population greatly exceeded the proportion in the slave population, the number of mulattoes to 1,000

blacks being 581 in the free colored population of 434,495, and 83 in the slave population of 3,204,313.

A table in the compendium of the Seventh Census gives the ratio of mulattoes to blacks in the Negro population, free and slave, of the several states and territories as shown in Table 2, the ratios representing populations shown in Table 25 (p. 221).

New Mexico.....	266.67	266.67
Oregon.....	360.00	360.00
Utah.....	108.33	60.00	388.89

¹ The Negro population of the territories was as follows: Free, Minnesota, black 16, mulatto 23; New Mexico, black 6, mulatto 16; Oregon, black 45, mulatto 162; Utah, black 15, mulatto 9; 26 slaves, 9 black and 17 mulatto, were reported from Utah, "on their way to California."

At each of the four censuses—1850, 1870, 1890, and 1910—the proportion mulatto in the Negro population has been lowest in the South, and at each of these censuses except that of 1850 it has been highest in the West. In 1910 the percentage mulatto was 20.1 in the South, 26.6 in the North, and 32.1 in the West. In the South the proportion mulatto increased from 10 in 1850, to 11.1 in 1870, to 13.7 in 1890, and to 20.1 in 1910. In the North the percentage decreased from 24.8 in 1850 to 20.3 in 1870, increased to 28 in 1890, and decreased to 26.6 in 1910. In the West the percentage increased from 23.4 in 1850 to 35.6 in 1870, and to 39.2 in 1890, and decreased to 32.1 in 1910. These proportions and the populations which they represent are given in Table 3.

The decrease in the proportion mulatto in the Negro population of the North and West during the 20 years 1890-1910 is probably accounted for by the migration of Negroes into these sections from the South. While the proportion mulatto among migrants out of the South may be higher than it is in the Negro popula-

NEGRO POPULATION.

tion of the South as a whole, it may very well have been considerably below the proportion in the Negro population resident in the North and West.

The number of mulattoes to 1,000 blacks in 1910 was 252 in the South, 363 in the North, and 473 in the West.

¹ Includes 18,636 Negroes enumerated in Indian Territory, not distinguished as black or mulatto.

INCREASE OF THE BLACK AND MULATTO ELEMENTS: 1850-1910.

The increases shown in Table 4 relate to the populations of Table 3. Omissions in the enumeration of Negroes in the South at the census of 1870 (see p. 26) affect the increases shown in Table 3 for the South and for the country as a whole, in the two 20-year periods 1850-1870 and 1870-1890, these increases as developed from the census returns being for the earlier period below, and for the later period above the true increases. Omissions at the census of 1870 do not, of course, affect the increases for the entire period of 60 years from 1850 to 1910 in any section of the country. Nor do they affect the increases shown for the North and the West in the periods 1850-1870 and 1870-1890, since the omissions were in the Southern states. The high percentage increases of the West in the earlier periods represent small absolute increases, chiefly by migration of Negroes into this section. As shown in Table 3, the total Negro population of the West in 1850 was only 1,241, the number of blacks being 950 and the number of mulattoes 291. Little specific

significance attaches to percentage increases based upon these small populations, and in Table 4 they have been combined with the populations of the North in computing increases for the period 1850-1910.

¹ Does not include 18,636 Negroes enumerated in Indian Territory, not distinguished as black and mulatto.

In the period of 60 years, 1850-1910, the increase of the black element in the Negro population amounted to 4,544,020, or 140.5 per cent, and the increase of the mulatto element to 1,644,935, or 405.4 per cent. The black population in 1910 was less than two and one-half times as great as in 1850, while the mulatto population in 1910 was more than five times as great as in 1850.

These relative increases obtained approximately in the South. In the North and West the relative increase of the blacks was greater, and of the mulattoes less than in the South, the percentage increase for the period of 60 years being for the black element, in the Negro population of the North and West combined 265.8 per cent, and in the mulatto element 308. Since the black element has during the period constituted more than two-thirds of the combined Negro population of these sections, and has constituted from nine-tenths to four-fifths of the Negro population of the South, the rate of growth of the Negro population as a whole approximates more nearly to that of the black, than to that of the mulatto element. In the South although the mulatto element increased from 1850 to 1910 by 426.1 per cent, the total Negro population of the South increased only 161 per cent, a rate

not greatly in excess of that shown by the black element, of 131.6 per cent. The corresponding increases per cent in the North and West were 308 for the mulatto element, 276.2 for the total Negro population, and 265.8 for the black element.

In the 20 years 1890-1910, the black element in the South increased 20.1 per cent and the mulatto element 90.4 per cent, and in each preceding 20-year period the relative increase of the mulattoes greatly exceeded that of the blacks. In the North and in the West the black element increased in the period 1890-1910 more rapidly than the mulatto, the percentage being 49.5 in the North and 108.7 in the West for blacks, as compared with 39.2 and 53.4 for mulattoes. In the preceding period of 20 years the mulatto element increased more rapidly than the black in both of these sections, and in the period 1850-1870 the black element increased more rapidly than the mulatto in the North, the reverse being the case in the small Negro population of the West.

Migration of Negroes from the South into the North and West undoubtedly accounts for the relatively more rapid increase of the black element as compared with the mulatto increase in these sections in the period 1890-1910. The proportion mulatto in the Negro population of the South in 1890 (13.7 per cent) was less than one-half as great as the proportion in the North (28 per cent), and if approximately the same proportion obtained among the Negro emigrants out of the South as obtained in the Negro population resident in the South, the effect of migration would be to add relatively larger numbers to the black than to the mulatto elements of the North and West.

The relatively low rate of increase (39.9 per cent) of the black element in the North in the period 1870-1890, as compared with the rate for the mulatto element in this section in the same period (113.4 per cent) is more difficult to explain, as is also the relatively low rate of increase of the mulatto element of the North in the period 1890-1910 (39.2 per cent) as compared with the rate for this element in the preceding 20-year period (113.4 per cent). These differences can not, it would seem, be accounted for by the differences noted above, in instructions to enumerators at the several censuses, as regards definition of the term "mulatto," since these differences, in so far as they affected the returns, would tend to an understatement of the mulatto increase in the earlier period and to an overstatement of that increase in the later period. The figures would seem to indicate that the proportion mulatto among migrants out of the South was greater in the period 1870-1890 than it was in the period 1890-1910. The absolute increase of the black element in the North was 143,762 in the period 1870-1890, and 249,609 in the period 1890-1910, the absolute increases for the mulatto element in these periods being 104,438 and 77,047—the absolute increase of the black element being much greater, and of the mulatto element consid-

erably smaller in the period 1890-1910 than in the 20 years preceding.

The Negro population is classified as black and mulatto, by divisions and states, and the percentage black and mulatto given in Table 22 (p. 218) for the three census years 1910, 1890, and 1870. The increases based upon this table are given in Table 23 (p. 219). Table 24 (p. 220) for divisions and states relates to the year 1860, and classifies the free and slave, black and mulatto population by sex. Similar data, without distinction of sex, are given, by states, in Table 25 for the year 1850.

PROPORTION MULATTO, BY SEX: 1910, 1870, AND 1860.

Data are available for the black and mulatto population by sex for the years 1910, 1870, and 1860, and in Table 5 the distribution by sex in the three years specified is shown for these elements of the Negro population, together with the excess of males or of females in each element, the number of males per 1,000 females, and the percentage black and mulatto for males and for females.

Mulatto.....	588,363	280,208	308,155	27,947	909	12.6	13.8

¹The classification by sex of the black and mulatto population was not made in the report for 1890; nor in the report for 1850, except for the free colored in Connecticut, Louisiana, New York City, and New Orleans. (See Table 8 of Chapter VI.)

At each of these censuses the number of females in the mulatto population exceeded the number of males, the number of males to 1,000 females being markedly lower in 1910 (886) than at either of the two earlier censuses (908 in 1870 and 909 in 1860).

In the black population the number of males exceeded the number of females in 1910 and in 1860, the returns for 1870 showing an excess of females in the black as in the mulatto population. This excess of females shown for 1870 in the census returns of the black population may have developed in consequence of the extensive omissions in the enumeration of Negroes at the Ninth Census, since it is not improbable that a larger proportion of males—who would be generally away from the home at the time the enumerator called—than of females failed of enumeration.

NEGRO POPULATION.

The excess of females in the Negro population as a whole has been commented upon (see Chapter IX, and also section on "Sex distribution by age" of Chapter X), and it appears from Table 5 that this excess is specifically characteristic of the mulatto element.

The percentage mulatto among males increased from 12.6 in 1860 to 19.7 in 1910, and among females from 13.8 in 1860 to 22 in 1910.

In Table 6 the sex distribution of the black and mulatto population is shown by sections.

The West.....	22,950	14,978	7,972	34.7
MALES TO 1,000 FEMALES.				
United States.....	989	1,018	888	
The South.....	984	1,013	877	
The North.....	1,018	1,050	937	
The West.....	1,207	1,296	1,041	

In each section, as in the country as a whole, the proportion mulatto among females in 1910 exceeded the proportion among males, the percentage mulatto being in the South 19 for males and 21.3 for females, in the North 25.5 for males and 27.7 for females, and in the West 29.9 for males and 34.7 for females.

The excess of males and of females, and the number of males per 1,000 females, in the black and mulatto elements, are shown in Table 7 by sections for 1910.

SECTION.	BLACKS AND MULATTOS: 1910.					
	Excess of males.		Excess of females.		Males to 1,000 females.	
	Black population.	Mulatto population.	Black population.	Mulatto population.	Black population.	Mulatto population.
United States.....	65,587		123,588		1,018	886
The South.....	41,775		111,932		1,013	877
The North.....	18,373		8,959		1,050	937
The West.....	4,439		323		1,296	1,041

Table 26 (p. 222) classifies the black and mulatto population of divisions and states in 1910 by sex, giving the excess of males and of females in each element, and the sex ratio. The sex distinction in the classification of the black and mulatto population is shown also for 1860, in Table 24 (p. 220).

The sex ratios of the Negro population, black and mulatto, are given in Table 8 in comparison with corresponding ratios for the other racial classes in the population for the three years for which data are available for the black and mulatto elements.

RACIAL CLASS.	MALES TO 1,000 FEMALES.		
	1910	1870	1860
Total population.....	1,060	1,022	1,047
Negro.....	980	962	936
Black.....	1,018	970	1,010
Mulatto.....	886	908	959
White.....	1,066	1,028	1,053
Native.....	1,027	1,009	1,037
Native parentage.....	1,040	995
Foreign or mixed parentage.....	1,292	1,153	1,151
Foreign-born.....
Indian.....	1,035	950	1,190
Chinese.....	14,301	12,841	18,581
Japanese.....	6,941	(?)

¹ Number of females less than 100.

In each of the racial classes distinguished in Table 8, except among Negroes, and specifically among mulattoes, and among native whites of foreign or mixed parentage, the number of males exceeded the number of females, in 1910. In 1870 and in 1860, also, excess of males over females characterizes all classes shown, other than Negro, except that females exceeded males in the Indian population in 1870.

PROPORTION MULATTO, BY AGE: 1910.

Table 9 gives the percentage mulatto in the Negro population classified by age periods, for the United States as a whole, and for each of the three geographic sections in 1910. The populations which these percentages represent are given in Table 27 (p. 223), which gives corresponding data for each of the three southern divisions. Similar data are given for Southern states in Table 28.

AGE.	PERCENTAGE MULATTO IN THE NEGRO POPULATION: 1910.							
	United States.		The South.		The North.		The West.	
	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.
All ages.....	19.7	22.0	19.0	21.3	25.5	27.7	29.9	34.7
Under 6 years.....	22.0	22.5	21.3	21.8	31.0	31.2	40.7	38.8
Under 1 year.....	24.0	24.2	25.3	25.5	32.0	32.2	43.0	39.4
5 to 9 years.....	20.9	21.5	20.2	20.8	30.4	30.1	37.4	38.8
10 to 14 years.....	20.5	21.5	19.9	20.8	29.2	29.3	36.8	37.1
15 to 19 years.....	20.4	22.6	19.7	22.0	27.9	28.0	36.7	38.6
20 to 44 years.....	19.0	22.6	18.1	21.8	24.1	27.1	27.6	34.0
45 years and over.....	17.4	20.3	16.5	19.5	22.9	25.5	27.8	31.6
Age unknown.....	17.0	18.7	16.6	18.5	18.6	19.7	21.2	18.2

In the Negro population as a whole, and in the Negro population of each geographic section, among both males and females, the percentage mulatto is highest in the population under 1 year of age, and lowest in the population 45 years of age and over, except that in the West the proportion among males 45 and over slightly exceeds the proportion among males 20 to 44 years of age.

While the change in the proportion mulatto by age is more or less irregular in the several sections, the proportion in the younger ages generally exceeds the proportion in the older ages among both males and females. This would necessarily be the case in a population in which the proportion mulatto was increasing by the gradual dissemination of white blood through the intermarriage of mulattoes with blacks, each generation showing a larger proportion affected with a strain of white blood.

PROPORTION OF CHILDREN IN THE BLACK AND MULATTO POPULATION.

Table 10 gives the percentage under 5 years of age in the black and mulatto elements of the Negro population, male and female.

SEX.	PERCENTAGE UNDER 5 YEARS OF AGE IN THE NEGRO POPULATION: 1910.		
	Total.	Black.	Mulatto.
Both sexes.....	12.9	12.6	13.7
Male.....	12.9	12.5	14.4
Female.....	12.8	12.7	13.1

Of the mulatto population 13.7 per cent were under 5 years of age in 1910, and of the black population 12.6 per cent. In the black population the proportion under 5 among females (12.7 per cent) slightly exceeded the proportion among males (12.5 per cent) and in the mulatto population the proportion among males (14.4 per cent) considerably exceeded the proportion among females (13.1 per cent).

While the higher proportion of children in the mulatto population might result from a higher birth rate in this element, as compared with the black element, or from a higher mortality in the adult population among mulattoes, as compared with blacks, the more probable explanation is to be found in the mixed marriages of mulattoes with blacks. The children of such marriages will in a majority of cases be classified as mulattoes, although only one-half of the parents are in this class. In other words, to the extent that blacks marry mulattoes they are in a majority of cases estopped from any natural increase whatever since their children are credited to the mulatto element.

PROPORTION MULATTO IN THE URBAN AND RURAL POPULATION.

The aggregate urban and rural Negro population, male and female, is classified as black and mulatto in Table 11, for the country as a whole and for each geographic section, the percentage mulatto in the urban and in the rural aggregates being given.

In each section in 1910 the proportion mulatto in the urban population exceeded the proportion in the rural, the percentage mulatto in the aggregate urban for the country as a whole being 27.2, and in the

aggregate rural 18.5. These were practically the proportions obtaining in the South.

Table 11

SECTION.	Urban.		Rural.		Percentage mulatto.	
	Black.	Mulatto.	Black.	Mulatto.	Urban.	Rural.
BOTH SEXES.						
United States.....	1,957,799	731,520	5,819,368	1,319,166	27.2	18.5
The South.....	1,350,050	591,405	5,638,517	1,256,455	27.2	18.2
The North.....	581,167	213,799	172,948	69,760	29.9	25.7
The West.....	26,492	13,316	7,903	2,951	33.4	23.7
MALE.						
United States.....	952,085	327,399	2,970,247	636,150	25.6	17.6
The South.....	646,439	219,507	2,870,232	603,447	25.3	17.4
The North.....	281,494	101,347	91,750	30,953	26.5	24.6
The West.....	14,152	6,545	5,265	1,750	31.6	24.9
FEMALE.						
United States.....	1,005,624	404,121	2,849,121	683,016	28.7	19.3
The South.....	703,611	281,898	2,788,285	653,078	28.8	19.1
The North.....	289,673	112,452	78,198	28,807	28.0	28.9
The West.....	12,340	6,771	2,638	1,201	35.4	31.3

In the North the proportion mulatto in the urban (26.9 per cent) is slightly lower than the corresponding proportion in the South. In the West 33.4 per cent, or one-third, of the urban Negro population is mulatto.

The proportion mulatto in the rural population of the North (25.7 per cent) and West (23.7 per cent) exceeds the corresponding proportion in the South, the rural proportion in the North approaching nearly to the urban proportion in the North and in the South.

The proportion mulatto among males is lower than among females in both the urban and the rural population.

Table 12 gives the number of males to 1,000 females in the black and mulatto population classified as urban and rural.

Table 12

RACIAL CLASS.	MALES TO 1,000 FEMALES: 1910.	
	Urban population.	Rural population.
Negro population.....	908	1,021
Black.....	947	1,043
Mulatto.....	810	931

In the urban population black and mulatto the number of females exceeds the number of males. In the rural black population males are in excess, and in the rural mulatto population females.

CLASSES OF URBAN COMMUNITIES.

Table 13 gives, by sex, the black and mulatto aggregate population for classes of urban communities, the percentage mulatto and the sex ratio being given for these urban classes.

NEGRO POPULATION.

Table 13 NEGRO POPULATION: 1910.

In the aggregate for each class of cities shown in Table 13 the percentage mulatto among both males and females exceeds the percentage mulatto in the rural aggregate, and in each urban aggregate, black and mulatto, the number of females exceeds the number of males.

The excess of males over females in the black and mulatto aggregates shown in Table 13 is given in Table 14, which distributes the excess of females in each of these elements by urban communities.

Table 29 (p. 227) classifies the black and mulatto urban and rural population, male and female, by divisions and states. The percentage mulatto in the urban and rural aggregates, the percentage urban in the male and female black and mulatto population, and the sex ratio in the urban and rural black and mulatto population are given, by states, in Table 30 (p. 228).

BLACK AND MULATTO POPULATION OF INDIVIDUAL CITIES.

Table 15 shows the percentage mulatto in the population of each of the 96 cities having in 1910 a Negro population of 5,000 or more. In 28 of these cities—20 in the South, 7 in the North, and 1 in the West—mulattoes constituted one-third or more of the Negro population. Greenville, S. C., with a Negro population 53.7 per cent mulatto, was the only one of the cities listed in Table 14 in which mulattoes constituted one-half or more of the Negro population. The seven other cities in which mulattoes constituted 40 per cent or more of the Negro population were the following: Portsmouth, Va. (49.5 per cent); Norfolk, Va. (48.7 per cent); Petersburg, Va. (48.2 per cent); Paducah, Ky. (47.3 per cent); Chicago, Ill. (41.6 per cent); Galveston, Tex. (41.2 per cent); and Detroit, Mich. (40 per cent). In 20 other of these cities the percentage mulatto ranged between 33.3 and 39.9.

The black and mulatto populations of the cities listed in Table 15 are given in Table 31 (p. 229).

Table 15

SCHOOL ATTENDANCE OF BLACK AND MULATTO CHILDREN.¹

The number of school age attending school and not attending school, of any kind, at any time between September 1, 1909, and April 15, 1910, is given, for the black and mulatto populations by sections, divisions and Southern states, in Table 32 (p. 230). Table 16 assembles the aggregates for sections, and gives the percentage in school by age periods.

AGE.	NEGRO POPULATION: 1910.				Percentage in school.	
	Black.		Mulatto.		Black.	Mulatto.
	In school.	Not in school.	In school.	Not in school.		
UNITED STATES.						
6 to 20 years.....	1,230,843	1,465,328	388,856	337,130	45.7	53.6

6 to 9 years.....	33,539	10,363	15,003	3,533	76.4	78.6
10 to 14 years.....	49,153	6,170	20,906	1,976	88.8	91.4
15 to 20 years.....	19,096	57,412	9,005	21,179	24.9	30.9
THE WEST.						
6 to 20 years.....	3,738	2,567	2,349	1,352	59.3	63.5
6 to 9 years.....	1,178	360	730	201	76.6	78.2
10 to 14 years.....	1,767	125	1,067	72	91.0	93.7
15 to 20 years.....	793	2,032	562	1,079	28.1	34.2

The black population 6 to 20 years of age, returned as attending school in 1910 numbered 1,230,843, and the number returned as not in school 1,465,328. Of the total not in school, 411,993 were 6 to 9 years of age, 305,247 were 10 to 14 years of age, and 748,088 were 15 to 20 years of age. Of the 305,247 black children 10 to 14 years of age not in school, 298,902 were in the South, 6,170 in the North, and 175 in the West. For black children of this age the percentage attending school was 65.1 in the South, 88.8 in the North, and 91 in the West.

The number of mulattoes 6 to 20 years of age returned as attending school in 1910 was 388,856, and the number not attending school 337,130. Of the mulatto children 10 to 14 not attending school, 55,976 were in the South, 1,976 in the North, and 72 in the West, the percentage in school for these children

being 74.4 in the South, 91.4 in the North, and 93.7 in the West.

The proportion attending school in the population of school age among mulattoes exceeds the proportion among blacks in each section of the country.

Table 17 gives the percentage attending school by sex for the black and mulatto population of school age.

AGE.	PERCENTAGE IN SCHOOL: 1910.			
	Male population.		Female population.	
	Black.	Mulatto.	Black.	Mulatto.
6 to 20 years.....	43.7	52.3	47.5	54.7
6 to 9 years.....	46.1	56.1	56.1	58.0
10 to 14 years.....	63.5	69.6	73.6	78.5
15 to 20 years.....	22.7	27.8	28.3	33.0

At each age period a larger proportion of females than of males were attending school in both the black and the mulatto population; and at each age period for both males and females the proportion in school was higher for mulattoes than for blacks.

The black and mulatto population 6 to 20 years of age, and the percentage in school for each class of Negro population is given in Table 18 by divisions and Southern states. Tables 19 and 20, also, present data for the black and mulatto element in the Negro population.

SECTION, DIVISION, AND STATE.	NEGRO POPULATION 6 TO 20 YEARS OF AGE.				PERCENTAGE IN SCHOOL.	
	Total.	Black.	Mulatto.		Black.	Mulatto.

and a slightly larger proportion, 21.2 per cent, of the population 6 to 20 years of age. They are proportionally more numerous in the North and West than in the South, constituting 29 and 37 per cent, respectively, of the Negro population 6 to 20 years of age in those sections. The proportion is nearly uniform in the three southern divisions, but in the northern divisions varies from 21.4 per cent in the Middle Atlantic to 36.5 per cent in the New England division. In the Southern states the lowest percentages are found in Delaware, South Carolina, Florida, Alabama, and Mississippi; the highest in West Virginia, the District of Columbia, and Virginia. The percentage in North Carolina is considerably higher than in South Carolina.

For each section and each division, except the West South Central, the percentage in school of mulattoes 6 to 20 years of age represents the majority of that age period; and in the southern divisions the only states showing less than 50 per cent are Georgia, Florida, Alabama, and Louisiana. The highest percentages are those for Oklahoma, 67.9; Delaware, 66; the District of Columbia, 62.4, and North Carolina and Mississippi, each 58.8. Compared with the percentages for the blacks, those for the mulattoes are higher in each section, division, and Southern state, the excess in favor of the mulattoes being greater in the South than in the North.

Similarly, as may be noted in Table 19, the different age periods show higher percentages for the mulattoes than for the blacks, among both males and females. This is true for each age period and for both sexes in every Southern state, and is true in the North and West except in New England and in the Mountain division, although the difference in the percentages for mulattoes as compared with blacks is in some cases slight. The situation in the Southern states as well as in the several sections, and for the two sexes, is set forth by age periods in the percentages of Table 19.

In general, it seems to be the fact that in those sections where opportunities are equal for all classes of population the difference between the blacks and mulattoes diminishes. This will be apparent from Table 20 which shows the excess of the percentage in school of mulattoes over blacks, by sections and age periods.

Table 20

SECTION.	EXCESS OF PERCENTAGE IN SCHOOL OF MULATTOES OVER BLACKS.			
	Total, 6 to 20 years of age.	6 to 9 years of age.	10 to 14 years of age.	15 to 20 years of age.
United States.....	8.0	9.8	9.5	5.5
The South.....	7.7	9.3	9.3	5.6
The North.....	4.5	3.2	2.6	4.9
The West.....	4.2	1.6	2.7	6.1

As a class the mulattoes include 20.9 per cent, or a little over one-fifth, of the entire Negro population,

ILLITERACY OF BLACKS AND MULATTOES.¹

The number and percentage illiterate in the black and mulatto, male and female, population 10 years of age and over, and in the male population 21 years of age and over, are given, by divisions and states, in Table 33 (p. 231). Table 21 summarizes the data relating to illiteracy for these elements of the Negro population, by sections and southern divisions.

In 1910 illiterates constituted 32.3 per cent of the male and 33.4 per cent of the female black population 10 years of age and over, the corresponding proportions in the mulatto population being 20.8 per cent for males and 21.2 per cent for females. These propor-

¹ For data relating to illiteracy in the Negro population, see Chapter XVI.

tions are equivalent approximately to one-third of the black population and to one-fifth of the mulatto population, male and female.

In the Negro population, male and female, the proportion illiterate was higher among blacks than among mulattoes in each section and southern division.

In both the black and the mulatto population, as a whole, the proportion illiterate is higher for females than for males.

The proportion illiterate among adult males 21 years of age and over was 35.5 per cent for blacks and 23.6 per cent for mulattoes. This proportion was highest in the Negro population of the East South Central division (41.4 for blacks, and 28.6 for mulattoes) and was lowest in the West (7.1 for blacks, and 5.6 for mulattoes).

ILLITERACY IN THE BLACK AND MULATTO POPULATION 10 YEARS OF AGE AND OVER, CLASSIFIED BY SEX, BY SECTIONS AND SOUTHERN DIVISIONS: 1910.

PART IV.—VITAL STATISTICS.

CHAPTER XII.—MARITAL CONDITION.....	Page. 235
CHAPTER XIII.—FERTILITY.—PROPORTION OF CHILDREN TO WOMEN OF CHILD-BEARING AGE....	283
CHAPTER XIV.—MORTALITY IN THE REGISTRATION AREA.....	298

CHAPTER XII.—MARITAL CONDITION.

MARITAL CONDITION CLASSES.

In the census tabulations relating to marital condition four classes of persons are distinguished—the single, the married, the widowed, and the divorced. Generally in the tables this distinction is confined to the population 15 years of age and over, since only an inconsiderable portion of the population under 15 are married, widowed, or divorced.

ACCURACY OF DATA.

It is recognized that the error attaching to the return of marital condition may be considerable. In some cases males who are or have been married, but are living apart from their families, may return themselves as single; females who have never been married, especially mothers with young children dependent upon them, may return themselves as either married, widowed, or divorced; married females deserted by their husbands may return themselves as widowed, the deserting husbands returning themselves as single; widowed males may return themselves as single; divorced males may return themselves as either single or widowed; and divorced females may return themselves as widowed. Where the return of marital condition is made by a third person, who does not know the facts, it is probably commonly presumed, and in some cases erroneously, that persons living apart from their families, especially males, are single. The result of these errors in combination would be, as regards the classification of males overstatement of the number single and understatement of the number married, widowed, or divorced, and as regards the classification of females overstatement of the number married and widowed, and understatement of the number single or divorced.

MARITAL CONDITION: 1910, 1900, AND 1890.

In Table 1 (p. 236) the classification by marital condition of the Negro population of all ages combined, and separately of the population under 15 years of age and 15 years and over, is given for 1910, 1900, and 1890, together with the excess of males or of females in each marital class. In 1910 cases of unknown marital condition in the population under 15 were classified as single.

In the total Negro population of all ages 59.6 per cent of the males and 53.9 per cent of the females were returned as single in 1910, and 40.1 per cent of the males and 45.9 per cent of the females as married, widowed, or divorced. The aggregate single embraced all persons who had not been married at any

time previous to the census enumeration, and the aggregate married, widowed, or divorced all other individuals of known marital condition, all of whom must have been married at some time previous to the date of enumeration, and some of whom had been either widowed or divorced.

Practically all of the population under 15 years of age was single, the number married, widowed, or divorced among the 1,826,569 males under 15 years of age in 1910 being only 139, and among the 1,838,538 females only 756. If it be assumed that all of those under 15 that were returned as having been married were in the age 14 years, as undoubtedly practically all of them were, approximately 1 male per 1,000 males aged 14, and 6 females per 1,000 females aged 14, were or had been married.

In the Negro population 15 years of age and over 35.4 per cent of the males and 26.6 per cent of the females in 1910 were single, and 64 per cent of the males and 73.1 per cent of the females were married, widowed, or divorced.

The number of females exceeded the number of males in the Negro population 15 years of age and over at each of the three censuses, but the distribution of males differed materially from the distribution of females to the several marital condition classes, giving at each census a large excess of males in the class of single persons, and of females in the class of married, widowed, and divorced persons.

The number of married males is necessarily at all times approximately equal to the number of married females, and would be exactly equal, as returned by the census, if the husband and wife were in every case both living within the area of census enumeration, and were correctly returned on the schedule as married. The small excess of females among married Negroes 15 years of age and over as returned at the several censuses (26,721 in a married population of 3,525,177 in 1910, 20,931 in 2,866,683 in 1900, and 11,921 in 2,362,947 in 1890) is probably accounted for in part by married males returning themselves or being returned as single; and in part by single females returning themselves as married. In some instances, however, married males may have emigrated to outlying possessions or to foreign countries, leaving their wives in the states, and it is probable that more males than females are omitted in the enumeration of the population. Among married whites, on the other hand, there is an excess of males over females, which probably represents immigrant husbands whose wives are still in foreign countries.

NEGRO POPULATION.

MARITAL CONDITION OF THE NEGRO POPULATION: 1910, 1900, AND 1890.

¹ Exclusive of 10,942 males and 8,394 females specially enumerated in 1890 in Indian Territory and on Indian reservations, for whom statistics of marital conditions are not available.
² Less than one-tenth of 1 per cent.

The widowed and divorced population there was at each census an excess of females (among the widowed an excess of 269,861 in 1910, of 262,874 in 1900, and of 228,511 in 1890; and among the divorced of 13,140 in 1910, of 11,007 in 1900, and of 5,476 in 1890). The sex distribution of these classes is explained by the fact that females as compared with males generally marry at younger ages. The marriage relationship is, therefore, naturally, since the husband is generally older, more often broken by death of the husband than by death of the wife, and consequently the number of widows in the population always exceeds the number of widowers. It is probably true also, that remarriages are more common among widowed males than among widowed females. Since the number married among females is approximately equal to the number married among males, the excess of females among widowed and divorced persons, to the extent that it exceeds the excess of females in the population 15 years of age and over, involves a corresponding deficiency of females—or excess of males—in the single population.

In the case both of males and of females the proportion single in the Negro population 15 years of age and over decreased in each of the two decades covered by Table 1, the decrease being very slight in the decade 1890-1900, but more marked in the decade 1900-1910. The proportion married increased during the decade

1900-1910 from 54 per cent to 57.2 per cent among males, and from 53.7 to 57.2 per cent among females. In the preceding decade the proportion married decreased among both males and females.

Table 2 gives the increase of each marital class in the population 15 years of age and over for each of the two decades 1890-1900 and 1900-1910.

¹ A minus sign (-) denotes decrease.

² The increase for the decade 1890-1900 is figured on the population in 1890 exclusive of the population specially enumerated in 1890 in Indian Territory and upon Indian reservations. These areas, which returned a Negro population of 16,636 in 1890, are included in the 1890 area of census enumeration.

³ Per cent not shown where base is less than 100.

MARITAL CONDITION.

The increase for the population 15 years of age and over amounted in the decade 1900-1910 to 16.2 per cent for males and to 15.3 per cent for females, these rates being considerably above the rates for males and for females returned as single, and considerably below the rates for other marital classes. The increase in the aggregate of married, widowed, or divorced males during the decade 1900-1910 was 23.6 per cent, and for single males 4.9 per cent, the corresponding increases for females being 20.7 and 2.5 per cent. No such marked difference in the percentages obtained in the decade 1890-1900, in which decade the number of single males increased 22.6 per cent, and the number of married, widowed, and divorced males 24.6 per cent, the corresponding percentages for females being 23.2 and 23.8 per cent.

The highest percentage increases in each decade for both males and females are for the class of divorced persons, the increase of 9,120 in the number of divorced males in the decade 1900-1910 amounting to 82.7 per cent, and the increase of 11,253 in the number of divorced females to 51.1 per cent. These increases, however, relate to numerically small groups, and constitute comparatively small proportions of the total increase.

COMPARISON WITH OTHER RACIAL CLASSES.

The marital condition of Negroes in comparison with that of other classes of population in 1910 is given in Table 3 for the total of all ages, and separately for the population under 15 years of age, and 15 years of age and over, together with the percentage distribution by marital condition for each racial class.

MARITAL CONDITION OF THE NEGRO AND OF OTHER CLASSES OF THE POPULATION: 1910.

NEGRO POPULATION.

The proportion single among Negro males and females 15 years of age and over in 1910 was lower than it was for any class of the native whites. This lower proportion may be explained in part by the fact that on the average Negroes marry at a younger age than whites, which accounts, also, in part for the somewhat higher proportion widowed among Negroes as compared with whites. The low proportion single among foreign-born whites is accounted for by the comparatively small proportion of this class in the ages of 15 to 19 years, in which age group the proportion single is large for all classes.

The proportion married is lower among Negro than among white females, and higher among Negro than among white males. The proportion widowed and the proportion divorced is higher among Negroes than among whites for both males and females.

The percentage single, married, widowed, and divorced, in each of the three years, 1910, 1900, and 1890, is given in Table 4 for Negro and for white males and females.

¹ Less than one-tenth of 1 per cent.

Among whites as among Negroes of both sexes the proportion single decreased in each decade. The proportion married among Negro and white males and females 15 and over increased during the decade 1900-1910, although in the preceding decade this proportion among Negroes fell off slightly. The proportion widowed increased slightly in each decade among Negro males. Among Negro females 15 and over it increased somewhat in the decade 1890-1900, but

decreased in the decade 1900-1910, being practically the same in 1910 as in 1890. The proportion divorced among both males and females, Negro and white, increased during the period covered by the table.

Single, widowed, and divorced persons, making up in the aggregate the unmarried portion of the population, constituted in 1910, 63.9 per cent of Negro males, and 63.9 per cent of Negro females of all ages. For the population 15 years of age and over the corresponding percentages were 42.3 and 42.4. In the case both of males and of females these proportions had decreased in 1910 as compared with 1900. In the preceding decade the proportion single, widowed, or divorced increased in the adult Negro population. In each year it was slightly higher for females than for males in the Negro population, and higher for males than for females in each class of the white population.

SEX RATIO BY MARITAL CONDITION.

The sex ratio, or number of males per 1,000 females, is shown in Table 5 for the Negro and for the white population, classified by marital condition.

AGE PERIOD AND MARITAL CLASS.	MALES TO 1,000 FEMALES.					
	Negro population.			White population.		
	1910	1900	1890	1910	1900	1890

Married, widowed, or divorced.....	864	843	838	944	921	910
Married.....	985	986	990	1,025	1,011	1,007
Widowed.....	413	365	299	471	445	394
Divorced.....	605	590	488	897	793	717
Unknown.....	1,601	2,100	925	2,845	2,663	3,522

In the total Negro population 15 years of age and over the number of males to 1,000 females in 1910 was 986. This was approximately the proportion in the married population (985), the proportion being much higher in the population classified as single (1,315), and much lower among widowed persons (413), and among divorced persons (605).

The proportion of males among widowed and among divorced persons increased in each decade—the number of males per 1,000 females among widowed persons from 286 in 1890 to 413 in 1910, and among divorced persons from 488 in 1890 to 605 in 1910.

As compared with the corresponding ratio in the white population, the proportion of males was lower in the total population 15 years of age and over, and in each of the marital classes, among Negroes.

MARITAL CONDITION BY AGE PERIODS.

The marital condition of the Negro population 15 years of age and over classified by age periods is given in Table 6.

MARITAL CONDITION.

239

The figures represented in this table are partially illustrated by Diagram I (p. 240) showing for the Negro population in 1910, classified by sex and age periods, the percentages single, married, and widowed. Diagram II (p. 242), shows for this year in less detail of the number single, and the number married, widowed, or divorced.

The percentage single decreases from age period to age period among both males and females (from 96.9 per cent among males and 81.2 per cent among females 15 to 19 years of age, to 4.1 and 3.7 per cent, respectively, among males and females 65 and over), the decrease being very rapid in the age periods 15 to 19, 20 to 24, and 25 to 29 years.

¹ Less than one-tenth of 1 per cent.

In these younger ages the percentage married necessarily increases very nearly in proportion as the percentage single decreases. In the more advanced ages, however, the increase in the percentage widowed covers a very considerable decrease in the proportion married. Among females the proportion married decreases rapidly after middle life (from a maximum of 76.3 per cent in the age period 30 to 34 years, to 29.9 per cent among females 65 and over), the decrease among males (from a maximum of 81.4 per cent in the age period 45 to 54 years, to 67.3 per cent among males 65 and over), beginning later in life and being much less considerable. At all ages the proportion widowed is higher for females than for males, and in advanced ages very much higher. Among females this proportion increases from 0.9 per cent in the population 15 to 19 years of age, to 65.6 per cent in the population 65 years of age and over, the corresponding increase among males being from 0.1 to 27.5 per cent. It thus appears that in 1910 nearly two-thirds of the females and over one-fourth of the males 65 years of age and over were widowed. The rela-

tively large proportion widowed among Negro females arises naturally in consequence of the fact that wives are generally younger than their husbands. It is probably true, also, that the rate of mortality is lower among females than among males in the advanced ages and that, as has been noted, a larger proportion of widowed males than of widowed females remarry.

Table 7 is a comparative table covering the last three censuses and showing for Negro males and females, classified by age, the percentage in each marital class and in the aggregate of the three classes embracing married, widowed, and divorced persons.

During the decade 1900-1910 the percentage single declined among both males and females in each of the age groups shown in Table 7, and the percentage married increased in each group except in the case of males 45 to 64 years of age and 65 years of age and over. In the preceding decade the percentage single declined slightly among Negro males and females 15 to 19 years of age, and among males declined also for the age group 20 to 24 years, females showing a slight increase for the age 20 to 24 years. Among both

NEGRO POPULATION.

males and females, however, in this decade the percentage single increased for each of the periods embracing the ages 25 to 64 years.

DIAGRAM I.—PERCENTAGE SINGLE, MARRIED, AND WIDOWED, FOR NEGRO MALES AND FEMALES, BY AGE PERIODS: 1910.

The percentage widowed has generally increased among males in the several age groups. Among females this proportion has not changed materially, the percentage among Negro females 65 years of age and over being 66.1 in 1890 and 65.6 in 1910; among females aged 45 to 64 years, 33.4 in 1890 and 32.9 in 1910; among those aged 35 to 44 years 17 in 1890 and 16.9 in 1910; and among those aged 25 to 34 years 9.1 in 1890 and 9.2 in 1910.

The percentage divorced has tended to increase for each age group among both males and females. It is slightly higher in the ages of middle life than it is in the younger or in the more advanced ages.

The percentage representing the proportion in the aggregate of the three classes embracing all persons who were at the time of the census, or had been at some time previous married, naturally increases from age to age, the increase for Negro males being in 1910 from 2.3 per cent in the population 15 years of age and over, and for Negro females from 18.1 to 95.9 per cent in these age groups, respectively.

¹ Less than one-tenth of 1 per cent.

The percentages of Table 7 are illustrated by Diagram III on page 242, showing the percentage married, widowed, or divorced by sex and age periods for the Negro population in 1910, 1900, and 1890. In the diagram it is apparent that while the percentages for females exceed those for males in the younger ages, the percentages for the two sexes tend to become equal in the more advanced ages. In the population 65 and over, for example, in 1910 the percentage married among males (67.3) slightly exceeded the percentage widowed among females (65.6), and the percentage widowed among males (27.5) was slightly exceeded by the percentage married among females (29.9), the sums of the percentages for these two marital classes (94.8 for males, and 95.5 for females) being approximately equal, although the percentage married was very much higher and the percentage

widowed very much lower among males than among females. The number of divorced persons in this age period was too small to materially affect the percentages for the several marital classes combined.

Comparison of Negroes with whites, as regards distribution by marital classes in 1910, is shown in Table 8, with detail by age.

¹ Less than one-tenth of 1 per cent.

In 1910 the percentage single for each age group shown in Table 8 was lower for Negroes than for native or for foreign-born whites, among both males and females, although in the total population 15 years of age and over, all ages combined, the proportion single was lower for foreign-born whites than for Negroes. The difference was most marked in the age group 20 to 24 years, in which the proportion single among males was 59.7 per cent for Negroes, 75.8 per cent for native whites, and 80.3 per cent for foreign-born whites; and among females 34.9 per cent for Negroes, 51.3 per cent for native whites, and 44.9 per cent among foreign-born whites.

For males the age of maximum percentage married in each class of whites, as among Negroes, was the age 45 to 54 years, and for females 35 to 44 years in each class of whites, and 30 to 34 years among Negroes.

The proportion married increases in the younger ages more rapidly among the Negroes than among whites in both sexes.

In the several classes the proportion widowed, which is at all ages lower for males than for females, becomes considerable in the population 45 years of age and over. Among Negro males 45 to 54 years of age in 1910 the percentage widowed was 10.6; among native white males 6.2, and among foreign-born white males 5.6. The corresponding percentages for the age group 55 to 64 years were 15.9 for Negroes, 11.1 for native whites, and 11.9 for foreign-born whites. In the population 65 years of age and over the proportion widowed was practically the same among Negro as among white males (27.5 per cent for Negroes and 27.1 for whites), the percentage for Negroes being somewhat above that for native whites (25.9), and somewhat below that for foreign-born whites (29.6).

Among females in 1910 the percentage widowed for Negroes exceeded the corresponding percentage for native whites at all ages. For the age group 30 to 34 years, the percentage widowed among females was 11 for Negroes and 3.2 for native whites; for the age 35 to 44 years the corresponding percentages were 16.9 and 6.4; for the age 45 to 54 years, 27.7 and 14.2; for the age 55 to 64 years, 42.4 and 27.4; and for the age 65 years and over, 65.6 and 56.2.

As regards the percentage divorced in the several classes, it is generally so small and probable inaccuracies in the returns for all classes are so considerable that little significance attaches to differences which may be noted in the table.

In Table 9 the distribution of the Negro population by marital condition is shown in comparison with that of native whites of native parentage in 1910, and in Diagrams IV and V (p. 242) and VI (p. 243) these distributions are illustrated.

NEGRO POPULATION.

DIAGRAM II.—NUMBER SINGLE AND NUMBER MARRIED, WIDOWED, OR DIVORCED, FOR NEGRO MALES AND FEMALES, BY AGE PERIODS: 1910.

DIAGRAM III.—PERCENTAGE MARRIED, WIDOWED, OR DIVORCED, FOR NEGRO MALES AND FEMALES, BY AGE PERIODS: 1910, 1900, AND 1890.

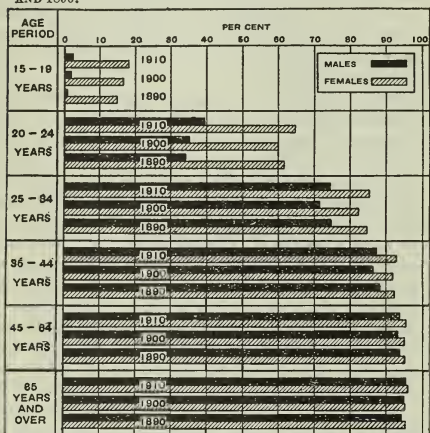

DIAGRAM IV.—PERCENTAGE WIDOWED, FOR NEGROES AND FOR NATIVE WHITES OF NATIVE PARENTAGE, BY SEX AND AGE PERIODS: 1910.

DIAGRAM V.—PERCENTAGE SINGLE, AND PERCENTAGE MARRIED, WIDOWED, OR DIVORCED, FOR NEGROES AND FOR NATIVE WHITES OF NATIVE PARENTAGE, BY SEX AND AGE PERIODS: 1910.

DIAGRAM VI.—PERCENTAGE MARRIED, FOR NEGROES AND FOR NATIVE WHITES OF NATIVE PARENTAGE, BY SEX AND AGE PERIODS: 1910.

The percentage married is somewhat higher among Negro males than among native white males of native parentage in the ages under 35 years, and somewhat lower in the ages 35 to 64 years, there being no difference between the classes in the percentage for the population 65 years of age and over. Among females the percentage married is higher among Negroes than among native whites of native parentage in the ages under 25 years, and is higher among native whites of native parentage for all older ages. The percentage widowed among native whites of native parentage, which is at all ages below that for Negroes, does not vary materially from the percentage shown in Table 8 for the aggregate native white population. At each age, among males and females, the percentage single is lower, and the percentage married, widowed, and divorced higher among Negroes than it is among native whites of native parentage. These differences in marital conditions between Negroes and native whites of native parentage are apparent in the diagrams.

MARITAL CONDITION BY SINGLE YEARS OF AGE FOR THE AGES 15 TO 34 YEARS.

Marital condition in 1910 of the Negro population, classified by single years of age for the ages 15 to 34 years, is shown in Table 10. In Diagram VII (p. 244) the number of married males and females in each single year of age shown in Table 10, is compared with the total male and female population in that age.

By reference to Diagram VII, it will be seen that the curves for married males and females move generally with the curves for total males and females. The irregularities in the reports of age have been considered in the chapter on age composition, and need not be further commented upon in this connection. These irregularities do not vary materially affect the proportion in the several marital condition classes, although the numbers in these classes, as in the total population, fluctuate irregularly. It will be noted, for example, that the very marked concentration of males and females in the age 30 is registered by an almost equally marked concentration of married males and females in this age. The number of married males aged 29 years was 47,770, the number aged 30 years 81,822, and the number aged 31 years, 34,137. For these ages the percentage married was 72.7 for the age 29 years, 71.3 for the age 30 years, and 74.9 for the age 31 years. Among females the fluctuation in numbers is equally marked, the percentage married showing in the case of females as in the case of males, a slight depression for the age 30 years, which probably does not in fact characterize this year of age.

The percentage single decreases from year to year for each of the single years of age shown in Table 10, in the case both of males and of females, except that the percentage single for the age 30 is slightly higher

Table 11 gives data for Negroes in comparison with native whites of native parentage, showing for 1910 the percentage married by single years of age. This table is illustrated by Diagram VIII (p. 244), in which the two upper curves represent the percentage married for females and the two lower curves the percentage married for males among Negroes and native whites of native parentage, respectively. The tendency of Negroes to marry younger is indicated by the more rapid ascent of the curves for Negroes.

SECTIONS AND DIVISIONS.

The marital condition of the Negro population is shown by sections and divisions for 1910 in Table 12.

In no one of the areas covered by Table 12 does the number married, widowed, or divorced in the population under 15 years of age amount to any appreciable proportion of the population of that age. When related not to the total under 15, but to the total in the age 14—on the assumption that all under 15 returned as having been married were in the age 14—the proportion married, widowed, or divorced amounted in the South to 0.1 per cent, or 1 in 1,000, for males, and to 0.6 per cent, or 6 in 1,000 for females.

¹ Includes those of unknown marital condition.² Less than one-tenth of 1 per cent.

Among Negro males 15 years of age and over the proportion single was highest in the West (45.5 per cent) and higher in the North (39.2 per cent) than it was in the South (34.8 per cent), no marked differences appearing in the proportion single as between the several southern divisions. The excess of males

which is a consequence of the selection effected by migration, in the population resident in the North, is obviously a condition tending to retard or prevent marriage for males. The proportion single among Negro females was not materially higher in the North than it was in the South (27.6 as compared with 26.4

MARITAL CONDITION.

247

per cent), and this percentage was lowest in the West (23 per cent), where the deficiency of females in the population was relatively greatest. In the southern divisions the percentage single among females was highest in the South Atlantic division (28.2), and lowest in the West South Central division (24.7).

The percentage married, widowed, and divorced is complementary to the percentage single, being relatively high or low in those sections in which the percentage single is low or high.

The table shows that there were resident in the South, in 1910, 162,326 widowed males in the Negro population 15 years of age and over; in the North, 26,364, and in the West, 1,280. The number of widowed females in the South was 394,169, in the North 62,536, and in the West 3,126. The proportion widowed among both males and females does not vary markedly from section to section or from division to division. Among males the lowest proportion widowed is that of 5.5 per cent, in the West; and the highest proportion that of 6.7 per cent in the West South Central division. Among females the lowest proportion widowed is that of 14 per cent in the

South Atlantic division, the highest that of 17.3 per cent in the West.

The number of divorced males in the South was 16,037, in the North, 3,744, and in the West, 365; the corresponding numbers for females being 28,472, 4,345, and 469. The proportion divorced for males ranged from 0.4 per cent in the South Atlantic division to 1.6 in the West, and for females, from 0.6 per cent in the South Atlantic to 2.6 in the West.

In each geographic section and division of the country there was in 1910, a considerable excess of males in the Negro population returned as single (amounting to 202,878 in the South, 50,234 in the North, and 6,364 in the West). Among married, widowed or divorced persons in each of these areas, there was an excess of females (amounting to 271,566 in the South, 36,757 in the North, and 1,399 in the West), except that a small excess of males for married persons was reported from the North and from the West.

Table 13 gives for the three years 1910, 1900, and 1890, data corresponding to that given in Table 15, except that the three southern divisions are not shown separately in Table 13.

² Totals include persons of unknown marital condition in 1900 and 1890.

³ Less than one-tenth of 1 per cent.

NEGRO POPULATION.

Among Negro males the percentage single in the South declined in the two decades covered by Table 13 (from 39 per cent in 1890 to 38.4 per cent in 1900, and to 34.8 per cent in 1910). The percentage married, in the South, declined slightly in the first decade (from 56.3 to 55 per cent), and increased during the last decade (to 57.9). Among Negro females, also, the percentage single declined in each of the two decades (from 29.8 per cent in 1890 to 29.5 per cent in 1900, and to 26.4 in 1910), and as in the case of males, the percentage married declined slightly in the decade from 1890 to 1900 (from 55 to 54.1 per cent), and increased in the decade from 1900 to 1910 (to 57.6 per cent).

In the North and West the percentage single among both males and females declined during the last decade, the percentage married increasing.

The percentage in each marital class is shown in Table 14, for the Negro and white population 15 years of age and over, in 1910, in each of the three geographic sections.

In each of the sections among males and females the percentage single for Negroes was lower than that for native whites, and higher than that for foreign-born whites. In each section the percentage married was lower for Negroes than for native whites, except that

among whites in the North it was slightly lower for native whites than for Negroes.

The percentage widowed in the South was slightly higher for the foreign-born white than for Negro males, but was higher among Negroes than among native whites in every section and among both males and females.

In each section the percentage divorced, although this percentage is very small in all classes, was slightly higher among Negroes than for the white classes.

In each section the percentage married, widowed, or divorced was higher among Negroes than among native whites for both males and females.

The number of males per 1,000 females in each marital class of Negro and white population is shown in Table 15, by sections. In the Negro population 15 years of age and over, in the South, the number of males per 1,000 females was 1,285 among those returned as single, and 863 among those returned as married, widowed, or divorced. The number of males per 1,000 females in the single population was higher in the North (1,471) than it was in the South (1,285), and was much higher in the West than it was in any other section of the country (2,529). In the married population the number of males per 1,000 females was 862 in the South, 1,054 in the North, and 1,054 in the West. In the population returned as widowed it was 412 in the South, 422 in the North, and 409 in the West. The corresponding figures for whites were, among married persons, 1,005 in the South, 1,028 in the North, and 1,061 in the West, and among the widowed, 466 in the South, 463 in the North, and 565 in the West.

¹ Ratio not shown, the number of females being less than 100.

The percentage in each marital class is given in Table 16, for the Negro population of each section, classified by age periods, in 1910, 1900, and 1890.

The percentage single decreased among Negro males and females, and the percentage married increased in each geographic section of the country during the decade 1900-1910, for the age groups 15 to 19 years, 20 to 24 years, 25 to 34 years, and 35 to 44 years.

¹ Less than one-tenth of 1 per cent.

In the South the percentage married in the Negro population 15 to 19 years of age increased among males from 1 in 1890 to 1.8 in 1900, and to 2.3 in 1910, and among females from 14.9 in 1890 to 16.1 in 1900, and to 17.5 in 1910. In the population 20 to 24 years of age the percentage married among Negro males increased from 35.4 in 1890 to 35.7 in 1900, and to 39.5 in 1910; among females the percentage decreased in the decade 1890 to 1900, from 58.6 to 56 per cent, and increased in the decade 1900-1910 to 60.3 per cent. In the more advanced ages the percentage married decreased among both males and females during the decade 1890-1900, and increased during the decade 1900-1910, except that it remained unchanged in the latter decade among males 45 to 64, and decreased among males 65 and over.

In the North, as in the South, the percentage married increased during the decade 1900-1910 in each age group among both males and females, except among males 45 to 64, and 65 and over, and in the West this percentage increased in each age and sex group without exception. In the North and West the percentage married at each age, in 1910 as at preceding censuses, was below that obtaining in the South.

The percentage widowed among females 45 to 64, and 65 and over in the South and in the North remained practically unchanged during the two decades. In the South at each census approximately one-third (from 32.3 to 33.2 per cent) of the females 45 to 64, and approximately two-thirds (from 65.1 to 65.7 per cent) of the females 65 and over were widowed, the corresponding proportions being somewhat higher in the North and in the West.

The percentage in each marital class among Negroes, classified by age in 1910, is given in comparison with corresponding percentage for whites in Table 17.

In each of the three geographic sections the proportion married in the population 15 to 19 and 20 to 24 years, both male and female, was higher among Negroes than among whites, and in the more advanced ages was lower among Negroes than among whites, except among Negro males in the South aged 25 to 29 years, and 65 years and over.

In each section, at each age, among both males and females, the proportion widowed among Negroes exceeded that among whites.

Table 28 (p. 261) shows the marital condition of the Negro population in detail by age for each of the nine geographic divisions in 1910, the age classification in this table being somewhat more detailed than that of other tables showing marital condition by sections and divisions. The table shows, for example, that of the total number of Negro males living in New England in 1910 (32,783), 18,172, or 55.4 per cent, were single; 12,894, or 39.3 per cent, were married; 1,454, or 4.4 per cent, were widowed; and 177 were divorced. Of the total, 7,828 were under 15 years of age, all of these

males being single except 1, who was returned as married. The number of males 15 years of age and over was 24,955, of whom 10,345, or 41.5 per cent, were single; 12,893, or 51.7 per cent, were married; 1,454, or 5.8 per cent, were widowed, and 177 were divorced. Each marital condition class is distributed by 12 age periods—under 15 years, 15 and over, 15 to 19, 20 to 24, 25 to 34, 25 to 29, 30 to 34, 35 to 44, 45 to 64, 45 to 54, 55 to 64, 65 and over, and age unknown. The number of males is thus distributed by marital condition and age in detail, and similar data are given for the 33,523 Negro females resident in this division.

THE STATES.

Statistics of marital condition in the several states are given in Tables 29 and 30 (pp. 263 to 266). Table 29 gives the marital condition of the Negro population by divisions and states, in each of the three years 1910, 1900, and 1890, showing for each state the number of Negro males and females 15 years of age and over returned at each of these censuses as single, married, widowed, divorced, or of unknown marital condition. Table 30 shows marital condition, by age periods, for the Negro population, by sections, southern divisions, and Southern states in 1910, the number and the percentage in each marital class being given by age periods. The percentages of Table 18 (p. 252) represent the populations of Table 29.

In the Southern states the percentage single in 1910 among Negro males ranged from 32.2 in Mississippi to 48.1 in West Virginia; the percentage married, from 45.7 in West Virginia to 61.1 in South Carolina; and the percentage widowed, from 4.8 in South Carolina to 7.8 in Arkansas. Among Negro females the percentage single in the Southern states ranged from 21.6 in Florida to 32 in North Carolina, the percentage in the District of Columbia being 33.1; the percentage married, from 53.3 in Virginia to 64 in Oklahoma, the percentage for the District of Columbia being 47; and the percentage widowed, from 11.1 in West Virginia to 16.8 in Kentucky and in Tennessee.

URBAN AND RURAL COMMUNITIES.

Statistics of marital condition for the population, classified as urban and rural, and for the urban population, classified according to size of urban communities, are given in Tables 19 to 26.

In Table 19 the Negro population 15 years of age and over, in 1910, living in urban communities—i. e., in communities of 2,500 or more inhabitants—and in rural communities, is classified by sex, age, and marital condition. The table shows that 947,605 of the 3,059,312 Negro males 15 years of age and over in 1910 were living in urban, and 2,111,707 in rural communities; that of those living in urban communities 350,598, or 37 per cent, and of those living in rural

MARITAL CONDITION.

communities 732,874, or 34.7 per cent. were single; that of the urban male population 590,757, or 62.3 per cent, and of the rural, 1,368,587, or 64.3 per cent, were married, widowed, or divorced—the number and

proportion in each of the several marital condition classes being separately shown. Similar data are given for females 15 years of age and over, and for males and females in each age group.

1 Less than one-tenth of 1 per cent.

The percentage single was somewhat higher, and the percentage married, widowed, or divorced somewhat lower in the urban than in the rural Negro population 15 years of age and over, both male and female.

In the age groups 15 to 19 years, 20 to 24 years, and 25 to 34 years, the percentage married was lower for males than for females in both the urban and the rural population, and in the older age groups higher for males than for females.

In the urban male Negro population, the percentage married increases from 1.8 in the age group 15 to 19 years to a maximum of 73.7 in the age group 45 to 64 years, and decreases to 60.5 in the population 65 years and over. The maximum percentage married is reached somewhat earlier, and is somewhat higher in the rural population, in which the percentage increases from 2.3 in the age 15 to 19 to 83.8 in the age 35 to 44, and decreases to 69.4 in the age 65

and over. Among females in urban communities the percentage married increases from 14 in the age 15 to 19, to a maximum of 66.4 in the age 25 to 34, and decreases to 20.9 in the age 65 and over; and in rural communities it increases from 18.1 in the age group 15 to 19 years to 80.1 in the age 35 to 44, and decreases to 33.8 in the population 65 and over.

In each age period the differences of marital condition as between males and females are very considerable in both the urban and the rural population. Of the urban population 65 years of age and over, for example, 60.5 per cent of the males, and 20.9 per cent of the females were married; and 32.6 per cent of the males, and 74.1 per cent of the females were widowed. In the rural population of this age the percentage married was 69.4 for males and 33.8 for females; and the percentage widowed, 26 for males and 61.9 for females.

¹ Ratio not shown, the number of females being less than 100.

The differences in marital condition by age are apparent in the sex ratios shown in Table 20. In the single population the number of males per 1,000 females in urban communities increases from 903 in the age 15 to 19 years, to 1,801 in the age 35 to 44 years, and decreases to 1,143 in the age 65 years and over; in rural communities, it increases from 1,168 in the age 15 to 19, to 1,810 in the age 25 to 34, and decreases to 1,228 in the age 65 and over. In the married population of urban communities the number of males per 1,000 females increases from 103 in the age 15 to 19 to 2,387 in the age 65 and over and in the married population of rural communities from 121 to 2,430. In the widowed population of urban communities, the proportion of males increases from 66 males per 1,000 females in the age 15 to 19, to 362 per 1,000 in the age 65 and over, and in the widowed population of rural communities from 91 per 1,000 in the age 15 to 19 to 539 per 1,000 in the age 45 to 64, decreasing to 497 per 1,000 in the population 65 years of age and over. In the class of divorced persons, the increase in the number of males per 1,000 females from the oldest to the youngest age period is in urban communities from 56 to 1,361, and in rural communities from 101 to 1,942.

The large excess of females in the married population 15 to 19, and of males in the married population 65 years of age and over, is of course accounted for by the fact already noted that husbands are generally older than their wives.

In Table 21 the percentage in each marital class is shown, by age periods, for the urban and rural

Negro and white population, and for native and foreign-born whites.

At all ages in the urban and rural population, male and female, the proportion single is lower among Negroes than among native whites. In the urban and the rural female population, and in the urban male population, the proportion married is higher for Negroes than for native whites in the younger ages, and higher for native whites than for Negroes in the older ages, the proportion married in the rural male population being higher for Negroes at all ages than for native whites. At all ages, in the urban and rural population, male and female, the proportion widowed is higher for Negroes than for native whites.

The tendency of Negroes to marry at younger ages than whites, which has been noted in connection with preceding tables, is clearly in evidence in the statistics for urban and rural communities. In the urban population 31.6 per cent of Negro males aged 20 to 24 years, as compared with 19.8 per cent of native white males of this age, were married, the corresponding percentages for rural communities being 40.4 for Negroes and 26.3 for native whites. Among females 20 to 24 years of age in urban communities, the percentage married was 50.5 for Negroes and 38.7 for native whites; the corresponding percentages in the rural communities being 63.2 and 55.6.

The percentage married, widowed, or divorced in urban and rural communities is given in Table 22 by combined age periods for the Negro population, and in detail of nativity and parentage for the white population.

The differentiation of native whites by parentage, made in Table 22, develops the fact that the proportion married, widowed, or divorced is higher among native whites of native parentage—male and female, at each age shown, in urban and in rural communities—than it is among natives of foreign or mixed parentage, and that the percentage among native whites of native parentage approaches, more nearly than that among native whites of foreign or mixed parentage, to the proportion in the Negro population. In the urban population 15 to 24 years of age, for example, among males the percentage married, widowed, or divorced in 1910 was 7.3 for native whites of foreign or mixed parentage, 12.4 for native whites of native parentage, and 19.5 for Negroes; among females the percentage was 18.1 for native whites of foreign or mixed parentage, 26.9 for native whites of native parentage, and 38.6 for Negroes. In the rural population the corresponding percentages were for males 7, 14.3, and 20.8, and for females, 23.5, 35.6, and 42.5.

MARITAL CONDITION.

Tables 23, 24, 25, and 26 are summary tables presenting statistics of marital condition in the urban and rural population of the North, the South, and the West. In the first two of these tables (23 and 24) the aggregate urban population in these sections and in the country as a whole is shown by classes of cities, distinguishing urban communities of 2,500 to 25,000 population, 25,000 to 100,000, and 100,000 and over. Table 25 without distinguishing classes of cities, introduces data for the white urban and rural population, classified by nativity, in comparison with data for Negroes, and Table 26 distinguishes age groups in the Negro urban and rural population of the several geographic sections.

Table 31 (p. 269) gives statistics for each of the nine geographic divisions, showing marital condition of the urban and rural Negro population, classified by broad age periods, and Table 32 (p. 271) gives statistics for states, showing marital condition of the urban and rural Negro population without distinction of age.

In the rural Negro population among males and females the percentage single is lowest in the South and highest in the West. The percentage married in the rural Negro population, male and female, is highest in the South. Among males this percentage is lowest in the West, the percentage in the West being 36.1, as compared with 58.7 in the South and 49.6 in the North. Among females the differences in the percentage married, from section to section, are inconsiderable, the percentage in the South being 60.3, in the North 58.8, and in the West 60.2.

In the urban population the percentage married among males is highest in the South and among females

it is lowest in the South. The differences in the percentage widowed, from section to section, and in the percentage divorced are not marked, although the percentage divorced among males and females, in urban as in rural communities, is somewhat higher in the West than it is in either the South or the North.

In the South, among both males and females, the percentage single is highest in the population living in cities of 100,000 and over, and lowest in the rural population. In the North and West the percentage single in cities of this class, among both males and females, is lower than it is in the rural population. In the South the percentage married, among both males and females, is lowest in the cities of 100,000 or more population, and highest in the rural population. In the North and West, the percentage married, among males, is lowest in the rural population and highest in cities of 100,000 or more; and among females is lowest for the class of small cities of 2,500 to 25,000 and highest in the rural population.

As regards the statistics for classes of cities shown in Tables 23 and 24, it is probably true that the marital condition of the population is affected much more by geographic location of the city, than it is by the size of the urban community.

The number of males per 1,000 females in the Negro population, classified by marital condition, is shown, by geographic sections, in Table 24 for the urban and rural population and for classes of cities.

In the single population there was in 1910 an excess of males over females in the urban and in the rural population, and in each class of cities in each of three sections, the excess being much more marked in the rural population in all sections of the country than it was in the urban aggregate or in any of the classes of cities distinguished. In the class of married persons there was an excess of females in the rural population of the South and an excess of males in the rural population of the North and West. In the urban population and in each class of cities there was an excess of females in this marital class in the South and in the North, and an excess of males in the West, except for cities of 25,000 to 100,000 in the West. In the widowed population the excess of females was very marked in each rural and urban class of population in each section, but was very much greater in each class of the urban population than it was in the rural in each of the three sections. Among divorced persons in urban and rural communities in each section, females largely outnumbered males, except in the rural population of the North, in which the number of males per 1,000 females was 1,553.

MARITAL CONDITION.

257

MARITAL CONDITION OF THE NEGRO POPULATION 15 YEARS OF AGE AND OVER, IN URBAN AND RURAL COMMUNITIES AND IN CLASSES OF CITIES: 1910.

1 Ratio not shown, the number of females being less than 100.

In each section of the country, as may be seen by reference to Table 25, the percentage single in the urban and in the rural population of both sexes was lower among Negroes than among native whites in 1910, except in the rural male population of the North and West. In each section the percentage married in the urban population of both sexes was higher for Negroes than for native whites, except that the proportion married among native white females in the South exceeded that among Negro females; in the rural population of both sexes in each section the percentage married was higher among native whites than among Negroes. In each section of the country in the urban and in the rural population of both sexes the percentage widowed was higher among Negroes than among native whites.

In the urban Negro population 15 to 24 years of age, 25 to 44 years of age, and 45 years and over the percentage single among males was lowest in the South and highest in the West. (See Table 26.) Among females in these age groups it was lowest in the West and highest in the North, although the differences in the percentages for females were not very marked. In the rural population of both sexes in these age groups the percentage single was lower in the South than it was in the North or West.

In the urban population the percentage married among males in each age group was highest in the South and lowest in the West; among females in each age group it was highest in the West and lowest in the

South, except that in the age group 15 to 24 years it was slightly higher in the South than it was in the North.

In the rural population in each age group the percentage married among males was highest in the South and lowest in the West, the differences from section to section being very marked. For the Negro male population 25 to 44 years of age in rural communities, for example, the percentage married was 79.2 in the South, 62 in the North, and 40.1 in the West. The differences from section to section in the percentage married among females were much less considerable than among males, the percentages for females corresponding to those just given for males being 79.9 in the South, 77.8 in the North, and 72.4 in the West.

In the single Negro population, urban and rural, in each age group, and in each of the three geographic sections, there was an excess of males over females, except that there was a slight excess of females in the urban population of 15 to 24 years in the South. The

MARITAL CONDITION.

excess was greater in the North than it was in the South in each age group, and was most marked in the West. In the age group 25 to 44 years, for example, the number of males to 1,000 females in the urban

population was 1,362 in the South, 1,845 in the North, and 3,153 in the West; in the rural population the corresponding numbers are 1,702 in the South, 2,881 in the North, and 8,916 in the West.

MARITAL CONDITION IN URBAN AND RURAL COMMUNITIES, OF NEGRO MALES AND FEMALES 15 YEARS OF AGE AND OVER CLASSIFIED BY AGE PERIODS, BY SECTIONS: 1910.

PRINCIPAL CITIES.

Statistics of marital condition for individual cities are given in Tables 33, 34, and 35 (pp. 273 to 282).

Table 33 gives the number in each marital class in 1910, by sex, for cities having in 1910 a total population, white and colored, of 100,000 or more, and corresponding data, so far as data are available, for these same cities in 1900 and in 1890. The data are available for the earlier years only in cases where the city reported in these years a population of 100,000 or more.

Table 34 gives for cities having in 1910 a total population of 100,000 or more, and a Negro population 15 years of age and over of 10,000 or more, statistics

of marital condition of the Negro population, classified by sex and age periods, showing the number and percentage single, married, and widowed, and the number divorced by six age classes.

Table 35 gives statistics of marital condition in 1910 for the Negro population in cities having in 1910 a population of 25,000 inhabitants or more, the cities being grouped by states in which they are located. This table shows for the Negro population 15 years of age and over, classified by sex, the number and percentage single, the number and percentage married, the number widowed, and the number divorced.

Table 27, following, assembles certain percentages given in Table 34, showing the percentage married, by age classes, for 19 cities of 100,000 or more population

NEGRO POPULATION.

in 1910. Of these cities, 9 are southern and 10 are northern.

Kansas City, Mo.	54.1	18.1	52.3	64.9	64.1	50.1	21.7
New York, N. Y.	50.2	10.1	44.5	62.6	60.6	42.2	15.5
Philadelphia, Pa.	52.2	9.9	46.0	65.6	64.8	45.2	19.2
Pittsburgh, Pa.	50.1	11.4	52.0	73.8	74.6	55.5	18.0
St. Louis, Mo.	54.3	18.9	54.3	68.7	63.7	45.1	19.4

Among males the percentage married was highest in Atlanta (58.7), and lowest in Louisville (49.3) and Columbus (49.3). Among females the percentage married was highest in Pittsburgh (60.1), and lowest in Richmond (44). In only two of the 9 southern cities (Birmingham and Memphis) did the percentage married among Negro females 15 years of age and over amount to 50 per cent or more, and in only 1 of the 10 northern cities (Boston) did this percentage fall below 50. In the case of males, the percentage married fell below 50 in only two cities—one southern (Louisville) and one northern (Columbus)—there being no marked differences in the percentage for males as between the northern and the southern group of cities.

Among males 15 to 19 years of age the percentage married in the southern cities ranged from 1.1 in Baltimore to 4.1 in Nashville, and in northern cities from 1 in Philadelphia to 2.9 in Indianapolis. Among females of this age in southern cities the percentage married ranged from 8.4 in Baltimore to 21.1 in Birmingham, and in northern cities from 7.9 in Boston to 18.9 in St. Louis. In all cities, southern and northern, among males and females, the percentage married is much higher for the age 20 to 24 years than it is in the age 15 to 19, and much higher for the age 25 to 34 than it is in the age 20 to 24. Among males in each city it is higher for the age 35 to 44 than for the age 25 to 34, but among females in 15 of the 19 cities, the percentage married for the age 35 to 44 is lower than for the age 25 to 34. Among males the percentage married in the population 45 to 64 years of age does not vary markedly from the percentage in the population 35 to 44 years, although in each city the percentage among males falls in the population 65 and over. Among females there is in each city a marked decline in the percentage married in the age 45 to 64, as compared with the age 35 to 44, and a still more marked decline in the population 65 and over.

CHAPTER XIII.—FERTILITY—PROPORTION OF CHILDREN TO WOMEN OF CHILD-BEARING AGE.

CHILDREN UNDER 14 YEARS OF AGE IN 1820.

The age composition of the Negro as of the white population at the several censuses indicates a continuous decline in the proportion of children, practically uninterrupted over a long period. The change in the proportion of children during a period of 90 years is summarized in Table 1, which compares 1820, the first year in which the age of the Negro population was returned at the decennial census, with 1900 and 1910, giving the number and the proportion of children under 14 in the population, and the number of children of this age per 1,000 women in the ages 14 to 44 years.

Because of the peculiar age classification of 1820, comparison of that year with the census years immediately succeeding can not be made, and because of differences between the age classification for Negroes and that for whites in 1820, some factors of estimate, as regards the number of white children and women in 1820, enter into the comparisons made in Table 1. These factors, as is explained in the note to the table, involve a distribution of the aggregate number of white children in the six-year age period 10 to 15 years inclusive, at the census of 1820, into two age groups as being under or over the precise age of 14 years, and this distribution is made upon the simple assumption that two-thirds of the children 10 to 15 were in the ages 10 to 13 years. The assumption somewhat underestimates the number of children, but is approximately correct owing to the low mortality in the ages 10 to 15 years. At each of the last four censuses, those, namely, of 1880, 1890, 1900, and 1910, for which data are available by single years of age, the number of white children returned for the ages 10 to 13 years slightly exceeded two-thirds of the number returned as 10 to 15. The margin of error in the assumption made can not, however, be considerable in its effect upon the proportion of children. The method of estimating employed for 1820 when applied to the 1910 data gives, in fact, for the proportion of children under 14 exactly the percentage, worked to one place of decimals (29.5), that is obtained for that year from the enumerated totals, by single years of age, and gives approximately the true ratio of children to women (see note to Table 1). No factors of estimate enter into any of the figures for the Negro population, estimates being employed with reference to the white population in order to produce figures for whites comparable with those available for Negroes.

In 1820, although the proportion of children under 14 in the Negro population (43 per cent) was approximately the same as the proportion in these ages in

the white population (estimated to be 43.7 per cent), the number of such children per 1,000 women 14 to 44 years of age in the Negro population (1,853) was very considerably below the number in the white population (estimated to be 1,999). In 1910 both the proportion of children in the Negro population (34.9 per cent) and the proportion of children to women (1,344 per 1,000) very considerably exceeded the corresponding proportions among whites (29.5 per cent and 1,202 per 1,000).

YEAR.	Total.	Women 14 to 44 years of age.	CHILDREN UNDER 14 YEARS OF AGE.		
			Number.	Per cent of total.	Per 1,000 women 14 to 44.

¹ Estimate. The age classification for 1820 gives for white males and females, the number under 10, 10 to 15, 16 to 25, 26 to 44, and 45 and over. In estimating the number of white females 14 to 44 years of age, and the number of white children under 14, it is assumed that one-third of the children 10 to 15 years of age were in the ages 14 and 15. Tested by the returns of 1910, 1900, 1890, and 1880, the method of estimating employed gives, as would be expected, a slight excess of females in the ages 14 and 15 years, and deficiency of children 10 to 13. If one-third of the number of white females returned at the census of 1910 as 10 to 15 years of age be added to the number returned as 16 to 44, the result (20,060,745) exceeds the enumerated number of females 14 to 44 years of age (20,061,647) by 12,922, or by less than one-tenth of 1 per cent. This is the deficiency of female children under 14, by estimate as compared with the enumerated number, the corresponding deficiency for males being 15,084. If the number of white children under 14 per thousand white women 14 to 44 in 1910 had been estimated as in 1820, it would have been 1,200 or 2 less than the enumerated number of 1,202. The relatively more rapid increase of population in the earlier period would tend to create an age distribution in which the proportion 10 to 13 in the total 10 to 15 would exceed the proportion found in later years. It seems probable, therefore, that the number of white children under 14 per 1,000 white women 14 to 44 in 1820 exceeded 2,000.

In each class of population the decline in the proportion of children under 14 for the period of 90 years, 1820 to 1910, is very marked. Among Negroes it is somewhat less than it is among whites, although it is to be noted that in the later decades of this period, for which data are available in greater detail, the decrease in the number of children under 5 years of age per 1,000 women 15 to 44 is in the aggregate somewhat greater among Negroes than among whites, the result being a closer approximation of the ratio for Negroes to that for whites. (See Table 3, p. 286.)

PROPORTION OF WOMEN AND OF CHILDREN AT EACH CENSUS: 1830-1910.

Detail regarding the number and the proportion of women 15 to 44 years of age and of children under 10, under 5, and under 1, as returned at each census,

1830 to 1910, is given in Table 2 for Negroes and whites.

As returned on the schedules the number of Negro children under 1 year of age decreased 9.5 per cent in the decade 1880-1890, and increased 18.9 per cent in the decade 1890-1900; and the number of children under 5 decreased 5.3 per cent in the decade 1880-1890, and increased 16.1 per cent in the decade 1890-1900. The decreases for the earlier decade were undoubtedly in part a direct consequence of omissions in the enumeration of the Negro population at the census of 1890. (See p. 27.)

These omissions and those at the census of 1870 (see p. 26) would not necessarily affect the proportion of children in the Negro population, since the proportion of omissions might be the same among children as in the older population, but the returns for these years obviously can not be accepted with any high degree of confidence in their accuracy as regards age composition.

It is to be noted, further, that the age returns for 1890 are essentially defective, not only on account of omissions, but also in consequence of a change in the form of the age inquiry at that census. In 1890 enumerators were instructed to return "age at nearest birthday," the age returned at other censuses being "age at last birthday." This change in the form of the inquiry would reduce the proportion of children in the population enumerated, especially the proportion of children under 1 year of age, below the proportion which would be returned where the inquiry called for age at last birthday.¹

Data are available showing the proportion of children under 10 years of age in the Negro and in the white population at each census beginning with that of 1830. It will be seen by reference to Table 2 that, excepting the decade 1870-1880, the proportion of children under 10 years of age in the Negro popu-

lation tended to fall off with a fair degree of regularity in the decades covered by the table, from approximately one-third, or 342 per 1,000 population (34.2 per cent) in 1830, nearly to one-fourth, or 255 per 1,000 population (25.5 per cent) in 1910. For the white population each census has shown a decrease in the proportion of children under 10—from 325 per 1,000 population (32.5 per cent) in 1830 to 218 per 1,000 population (21.8 per cent) in 1910. At each census the number of children under 10 per 1,000 Negro population has exceeded the corresponding number for the white population, the excess amounting to 16 in 1830, in which year the number for whites most nearly approximates that for Negroes—to 66 in 1880— which is the year of greatest difference, and to 36 in 1910.

No data are available for the Negro population under 5 and under 1 in the years 1830 and 1840. In the period from 1850 to 1910 the proportion under 5, as well as the proportion under 10, tended to decline from census to census, the aggregate decrease for children under 5 being from 16.5 per cent in 1850 to 12.9 per cent in 1910. A similar decline is shown for the white population from 14.8 per cent to 11.4 per cent.

The proportion under 1 in the Negro population was highest in 1880 and was nearly the same in 1910 as in 1850, the percentages being 2.5 in 1850, 3.5 in 1880, and 2.6 in 1910. In the white population the proportion under 1 declined from a maximum of 3 per cent in 1860 to 2.4 per cent in 1910, the percentage in 1850 (2.7) being slightly lower than that of 1860.

The decline in the proportion of children in the Negro and in the white population is undoubtedly in large part a direct consequence of a decline in the birth rate, but a decline in the proportion of children may indicate also improvement in specific mortality rates. It is probably true of the Negro population that its general mortality rate affecting all ages in some degree has decreased in recent decades, and as regards the white population evidence of a general decrease is conclusive. The natural consequence of such a decrease in a sufficiently long period would be a decrease in the proportion of children, although the first effect of a reduction in mortality, if confined principally to mortality of infants and very young children, would be to increase temporarily the proportion of children. Improvement in mortality from period to period, and differences in mortality between the classes, must be taken into account in considering the proportion of children in the Negro and in the white population in different years.

The change in the proportion of women 15 to 44 years of age in the Negro and in the white population has been much less considerable in the period covered by Table 2 than the change in the proportion of children. In 1850 women 15 to 44 constituted 22.3

¹ Classified according to age at nearest birthday children 6 to 18 months old would be returned as 1 year of age, leaving for the age under 1 year only children less than 6 months old, while classified according to age at last birthday all children under 12 months old would be returned as under 1 year of age. As regards the age group under 5 years, the classification by age at nearest birthday includes in this group children up to the age of 54 months (4½ years), while the classification according to age at last birthday includes children up to the age of 60 months (5 years). If enumerators had followed instructions in 1890 a very great decrease must have developed from the schedule returns in the number of children under 1 year of age for the decade 1880-1890, and a marked increase for the succeeding decade. As shown in Table 2, according to the returns, the percentage under 1 year of age in the Negro population declined during the decade 1880-1890 from 3.5 to 2.8, and was the same in 1900 as in 1890. In the white population also a small decrease in the proportion under 1 year of age is shown for the decade 1880-1890, and no change for the decade 1890-1900, while among both Negroes and whites the decrease in the proportion of children under 5 and under 10 was more considerable in the earlier of these two decades. These changes were undoubtedly in some degree effects of the change noted in the age inquiry, but it is evident that enumerators can not generally have followed instructions at the census of 1890, as regards children under 1 year of age, restricting that class to children under 6 months old, since such a restriction would have developed much greater differences in the proportion for this age than are shown in the returns.

per cent of the Negro and 22.5 per cent of the white population. The proportion tended to increase slightly from decade to decade to 24.8 per cent for

Negroes and to 23.6 per cent for whites in 1910, the differences between the percentages for Negroes and those for whites being generally small.

NUMBER, INCREASE, AND PROPORTION OF NEGRO AND WHITE WOMEN 15 TO 44 YEARS OF AGE, AND OF CHILDREN UNDER 10, UNDER 5, AND UNDER 1, AT EACH CENSUS: 1830-1910.

¹ Figures in italics are estimates. The number of Negro children under 5 in 1890 is estimated by assuming that the proportion under 5 in the colored other than Negro under 10 was the same in 1890 as in 1900 (51.5 per cent), data being available for Negro and for colored under 10 and under 5 in 1900, for colored in these age groups in 1894, and for Negro under 10 in 1890. The margin of error is measured by the probability of change during the decade 1890-1900, in the proportion under 5 of the colored population other than Negro under 10. As the total colored population other than Negro under 10 in 1890 is estimated by assuming that there was the same proportion under 10 in the colored population other than Negro under 5 as the same proportion under 11 in the colored population other than Negro under 5 was the same in 1890 as in 1900 (29.9 per cent), the estimated number under 5 of colored other than Negro under 5 in 1890 being 7,656, and the estimated number under 1 year, 2,048, in a total under 5 of 1,055,045, and under 1 of 507,614. In this case also, the number of colored other than Negro under 1 is too small for any error in the estimate materially to affect the figures for Negroes.

In estimating the number of Negro females 15 to 44 years of age in 1880, it is assumed that of colored females other than Negro the proportion 15 to 44 years of age was the same in 1880 as in 1890 (31.1 per cent). The total number of colored females, number of Negro in 1880 was 37,235, of whom 32,422 were Indians, 4,773 were Chinese, and 14 were Japanese. The racial character of the colored population other than Negro—exclusive of the specially enumerated in 1890—did not change materially during the decade 1880-1890, and it is probable that there was no material change in the age distribution of females in this population element. In this case, as in the case of children under 5, and under 1 in 1890, the number of colored other than Negro in the aggregate of colored females (37,125 in a total of 1,468,424), is too small for any change in the age of distribution during the decade to be of material consequence in estimating the number of Negro females 15 to 44. In estimating the number of Negro children under 10 in 1890, it is assumed that the proportion under 10 in the colored other than Negro was the same in 1880 as in 1890 (8.8 per cent). In this case the margin of error in the estimate is measured by the probability of change in the proportion under 10 among the colored other than Negro, numbering

172,020 in 1880, in an aggregate colored of 2,151,606. The number of Negro children under 5 in 1880 is estimated by assuming that the proportion under 5 in the total Negro under 10 was the same among Negroes as in the aggregate colored under 10 (51.8 per cent). This percentage can not have been materially affected by the colored other than Negro under 10, estimated to number in 1880 only 15,132 in an aggregate colored under 10 of 2,151,606. The number of Negro children under 1 in 1880 is estimated by assuming that the proportion under 1 among colored other than Negro under 5 was the same in 1880 as in 1900 (26.9 per cent). The total colored other than Negro under 5 in 1880, as estimated, was 2,896, in an aggregate colored under 5 of 1,114,365, and the colored other than Negro under 1 in 1880, as estimated, was 2,118 in an aggregate colored of 229,196.

² In estimating the number of Negro females 15 to 44 years of age in 1850 and in 1860, it is assumed that of Negro females 40 to 49 years of age in each of these years, the proportion 40 to 44 was the same as among Negro females 40 to 49 in 1857 (57.9 per cent). The error in the estimates is determined by the variation from census to census in the proportion 40 to 44 among females 40 to 49 years of age. The changing age distribution of the Negro population during the period for which data are available would indicate as probable that the percentage 40 to 44 among females 40 to 49 in 1870 to 1900 this proportion declined from 57.9 to 54.4 per cent, being only slightly higher, 54.5 per cent, in 1890. But no probable variation in the proportion would be of material consequence in the estimates.

³ In the case of each of these estimates it may be stated that the margin of error is probably no greater than the margin of error in the enumeration of the Negro population, and that the estimates are probably as close to the true population in each case as would have been figures obtained by a tabulation of scheduled returns.

⁴ Exclusive of the specially enumerated in 1890.
⁵ A minus sign (—) denotes decrease.
⁶ The increase, 1890-1900, is figured on the population in 1890, including in the population for that year the specially enumerated.

CHILDREN UNDER 5 PER 1,000 WOMEN 15 TO 44 YEARS OF AGE AT EACH CENSUS: 1850 TO 1910.

In the succeeding tables of this chapter the number of children under 5 is related to the number of women 15 to 44 years of age, and the number of children per 1,000 women in these ages is given.

Table 3 gives these numbers for the Negro population at each census for which data are available for the Negroes, and introduces similar figures for whites. It shows, for example, that the number of children under 5 per 1,000 women 15 to 44 decreased among Negroes from 741 in 1850 to 519 in 1910, and among whites from 659 in 1850 to 484 in 1910. In each decade among Negroes, as among whites, the number of children per 1,000 women decreased, except that the number increased for Negroes, in the decade ending in 1880 (according to the schedule returns), and for whites in the decade ending 1860.

At each census the number of children relatively to the number of women was greater among Negroes than among whites, although in consequence of the somewhat more rapid decrease for Negroes, the difference in the ratios of children to women between Negroes and whites was less in 1910 than in any earlier year.

As compared with the ratio in 1910, the number of children per 1,000 women 15 to 44 in 1850 was greater by 222 in the case of Negroes, and by 175 in the case of whites, these numbers being the excess of the number of children per 1,000 women in 1850 over the number in 1910.

COMPARISON OF NEGRO WITH OTHER RACE AND NATIVITY ELEMENTS.

In the census returns children of foreign-born parents are classified as native of foreign parentage, and children having one parent native and one parent foreign born as natives of mixed parentage. For the aggregate population of all ages a further differentiation is made in the tabulations from the schedules, distinguishing natives born of native mothers and foreign-born fathers from natives born of foreign mothers and native fathers. The age classification, however, is not extended to these latter classes, and it

is therefore necessary in any attempt to arrive at a figure which will represent the proportion of children to women for native white women and their children, as distinguished from foreign-born white women and their children, to estimate the number of children under 5 years of age born of native mothers and the number born in this country of foreign-born mothers. Such estimates have been made in Table 4, as explained in the note attached to the table, and ratios of children to women figured for native and for foreign-born white women. The table includes, also, data for Negroes, for the aggregate white population, for Indians, and for the "other colored" population.

Table 4

RACIAL CLASS.	Children under 5 years of age.			
	Women 15 to 44 years of age.	Of class specified.	Having mother of class specified.	
			Number.	Per 1,000 women 15 to 44.
All classes.....	21,768,408	10,631,364	10,631,364	488
Negro.....	2,435,189	1,263,288	1,263,288	519
White.....	19,270,619	9,322,914	9,322,914	484
Native white.....	15,904,942	7,106,656	447
Both parents native.....	6,546,282
Native mother and foreign father.....	1,600,404
Foreign-born white.....	3,365,677	102,507	2,216,228	658
Both parents foreign born.....	1,819,847
Foreign mother and native father.....	1,295,874
Indian.....	53,788	40,384	40,384	751
Chinese, Japanese, and other colored.....	8,812	4,778	4,778	542

¹ Estimate. It is assumed that in the native white population of mixed parentage (i. e., reporting one parent native and one foreign born), the proportion under 5 years of age (14.3 per cent) obtained equally among those reporting native mothers and foreign fathers (3,959,845), and those reporting foreign mothers and native fathers (2,057,681), being the same for each of these classes as in the aggregate for the two classes combined (the aggregate of mixed parentage), for which age data are available.

Accepting the estimates of Table 4 as being approximately correct, it will be apparent that the proportion of children under 5 to women 15 to 44 was higher in 1910 for Negro women than it was for native white women, and lower for Negro women than it was for foreign-born white women. In 1910 the number of children per 1,000 women was 519 in the case of Negro women, 447 in the case of native white women, and 658 in the case of foreign-born white women.

The corresponding ratio for the Indian population was 751 per 1,000, and for the Chinese, Japanese, and other colored combined 542.

Ratios similar to those presented in Table 4 are given in Table 5 for Negro and for native and foreign-born white women covering the three years 1910, 1900, and 1890.

As has been noted already, the ratio of children to women has tended to decline from census to census in the case both of Negroes and of whites, and it appears from Table 5 that this decline is in evidence in the case both of native white women and their children and of foreign-born white women and their children,

although the proportion for foreign-born white women and their children was somewhat higher in 1900 than in 1890. In the case of native white women and their children, the ratio declined from 476 in 1890 to 464 in 1900, and to 447 in 1910. The corresponding figures for foreign-born white women and their children were 699 in 1890, 722 in 1900, and 658 in 1910.

¹ Figures in italics are estimates. For method of estimating the number of Negro children under 5 and of Negro women 15 to 44 in 1890, and of white children of native and of foreign-born mothers in 1910, see footnotes to Tables 2 and 4.

In estimating for 1900 the number of native white children having native and having foreign mothers, it is assumed that among the 3,346,652 native whites reporting native mothers and foreign fathers in 1900 the proportion under 5 was the same as among the total of native whites having one or both parents foreign born (18.4 per cent.). In 1910 the proportion under 5 (14.1 per cent.) among native whites of foreign parentage (both parents foreign born), was practically the same as the corresponding proportion (14.3 per cent.) among native whites of mixed parentage (one parent, either father or mother, native and the other foreign born), and it is improbable that the proportion under 5 among native whites reporting native mothers and foreign fathers differed materially from that among those reporting foreign mothers and native fathers. As regards the derived number of children under 5 per 1,000 white women 15 to 44, the margin of error is inconsiderable in the case of native white women, of whose children 5,464,881 were classified as native, both parents native. To this number is added 518,933 as the estimated number of native white children of foreign fathers and native mothers. The number of children born of native mothers is, therefore, more than nine-tenths as compiled and tabulated figure, the estimate applying to less than one-tenth. The number of children per 1,000 native white women would not be materially affected by any probable error in this estimate. An error of 10 per cent., or of 51,000, in the estimate of 518,933, would mean that the number of children per 1,000 native white women as estimated was 4 too large or too small—that it should have been either 443 or 451 instead of 447. As regards the foreign white women, an error in the estimate would have a more considerable effect upon the proportion of children, an error of 51,000, for example, being equivalent to an error of approximately 19 in the number of children per 1,000 foreign white women. Such an error would, however, involve a difference in the proportion of children under 5 between the total of native whites having one or both parents foreign born and the component class of those having native mothers and foreign fathers, greater by about twenty times than the difference which actually obtained in 1910 in this proportion between native whites one or both parents foreign born as a whole and the component class, native whites one parent foreign and one native.

Similarly in Table 6 in estimating for 1890, it is assumed that among the 2,378,729 native whites reporting native mothers the proportion under 5 was the same as among the total of native whites reporting one or both parents foreign born (18.9 per cent.).

SECTIONS AND DIVISIONS.

Table 6 gives the number of children per 1,000 women 15 to 44 in the several geographic sections and southern divisions, covering the four census years 1880

to 1910. For the years 1880 and 1890 requisite data are not available by sections and divisions for the Negro population separately, the classification of these years being for the aggregate colored. In Table 6 data are given for the colored population in these years and in 1900, and for Negroes in 1900 and in 1910. The variation of the figures for the aggregate colored from those for Negroes in the several sections and divisions may be noted in the figures for 1900, for which year ratios are given for Negroes, together with corresponding figures for the aggregate colored. In the South as a whole the number of children per 1,000 women in 1900 was 621 in the aggregate colored, and 619 in the Negro population. In the South Atlantic and in the East South Central division the ratios are the same for Negroes as for the aggregate colored, being 630 to 1,000 in the South Atlantic and 598 per 1,000 in the East South Central division. In the West South Central division a slight difference develops between the ratio for Negroes and that for the aggregate colored, the number of children per 1,000 women being 627 for Negroes and 633 for the total colored. In the North the difference is more considerable—the corresponding numbers being 317 for Negroes and 336 for the colored—and in the West it is very marked—the numbers being 269 and 516, respectively. It is apparent from these figures for 1900 that no particular significance attaches to the ratios for the aggregate colored in the West in 1880 and in 1890 as indexes of conditions obtaining in these years in the Negro population of this section, and that considerable allowance must be made for incomparability of data in the North. In the South, however, the number of colored other than Negro was too small to affect materially the ratios for the aggregate colored, which may therefore be accepted as ratios for the Negro population.

In the South among Negroes the number of children per 1,000 women 15 to 44 declined from 793 in 1880 (colored population) to 554 in 1910, the corresponding decline for the white population being from 711 in 1880 to 617 in 1910. In this section the ratio of children to women was higher among Negroes than among whites in 1880, and higher among whites than among Negroes in 1910.

In each of the southern divisions the ratio in 1910 was higher for whites than for Negroes.

Among Negroes in the South and in each of the three southern divisions, in each decade covered by Table 6 the proportion of children fell off. In the white population also in each of these areas the proportion of children declined during each decade, with the exception of slight increases in the decade 1890-1900 in the South as a whole, and specifically in the South Atlantic division.

White	434	477	516	634	-43	-39	-118

¹ Estimated. See Note 1, Table 2, p. 285.

The proportion of children to women in the Negro population of the North and West is, relatively to the proportion in the South, much lower, the number of children under 5 per 1,000 women 15 to 44 in 1910 being in the North 282 and in the West 231, as compared with 554 in the South.

CHILDREN UNDER 5 YEARS OF AGE PER 1,000 MARRIED WOMEN.

The number of children under 5 in the several divisions in 1910 and in 1900 is related in Table 7 to the number of married women 15 years of age and over.

SECTION, DIVISION, AND YEAR.	POPULATION: 1910.					
	Married females 15 years of age and over.		Children under 5 years of age.		Children under 5 per 1,000 married females 15 and over.	
	Negro.	White.	Negro.	White.	Negro.	White.
United States:						
1910	1,775,949	15,832,011	1,263,268	9,322,914	711	588
1900	1,445,817	12,319,767	1,215,655	7,919,552	842	643
The South:						
1910	1,554,357	3,821,883	1,176,331	2,860,467	757	749
1900	1,278,965	2,849,481	1,135,793	2,315,571	888	813
The North:						
1910	211,347	10,782,530	83,729	5,816,524	396	539
1900	159,650	8,782,772	77,794	5,105,906	487	592
The West:						
1910	10,245	1,248,098	3,228	645,923	315	513
1900	5,202	687,514	2,068	408,385	398	594

While the proportion married among Negro females 15 years of age and over was somewhat higher in the South than it was in the North and West in 1910—57.6 in the South, 54.7 in the North, and 56.6 in the West—the differences in the proportion married between the several sections do not seem sufficient to account for the differences in the proportion of children.

Per 1,000 married Negro women in the country as a whole the number of children under 5 was 711 in 1910 and 842 in 1900, the corresponding figures for whites being 588 and 643. In the several sections in 1910 the number of Negro children per 1,000 married women was 757 for the South, 396 for the North, and 315 for the West. In each section the number of children under 5 per 1,000 married women declined during the decade among Negroes and among whites. In both classes of population the proportion of children to married women was much higher in the South than it was in the North. In the South the proportion of 757 per 1,000 among Negroes slightly exceeded the proportion of 749 per 1,000 among whites, while in other sections, although the proportion for whites was much lower than the proportion for whites in the South, the proportion for Negroes was much lower than that for whites.

THE STATES.

Data corresponding to the data given in Table 6 for sections and southern divisions are given in Table 8 for Southern states. For the Negro and for the white population the number of women 15 to 44 years of age, of children under 5, and of children under 5 per 1,000 women 15 to 44, is given for 1910 and for 1900 in Table 11 (p. 294) for all states and for each of the nine geographic divisions.

In each Southern state in the decade 1900-1910 the proportion of children under 5 to women 15 to 44 in the Negro population decreased, and except for small increases in South Carolina, Georgia, Alabama, Mississippi, and Arkansas, the corresponding proportion for whites also decreased. By reference to Table 11 it may be seen that decreases were general in the Northern and Western states, as well as in the Southern—only five Northern states—four of them in New England—and four Western showed increases in the proportion of children for Negroes, and four Northern states—three of them in New England—and no Western state, increases for whites.

In the Southern states, among Negroes in 1910 the number of children under 5 per 1,000 women 15 to 44 ranged from 381 in Kentucky to 661 in North Carolina (the number for the District of Columbia being 234), and among whites from 422 in Delaware to 700 in Arkansas (the number for the District being 299); in the North (see Table 11) the range for Negroes is from 158 in Nevada to 405 in Vermont, and for whites from 347 in California to 670 in North Dakota.

The number of Negro women 15 to 44 years of age living in the Middle Atlantic division in 1910 was 131,605, the number of children under 5 years of age 35,298, giving a ratio of 268 children per 1,000 women, which is less than one-half the corresponding ratio of 577 for the South Atlantic division and almost precisely one-half the ratio of 535 for the East South Central division, and of 532 for the West South Central division.

the country as a whole is that approximately nine-tenths of the Negro population was resident in the South, where the ratios for both Negroes and whites are high relatively to ratios in the North and West, while nearly three-fourths of the white population were resident in the North and West. The high ratios of the South are heavily weighted in the average for the Negro population as a whole, and the relatively low ratios of the North and West in the average for the white population.

Proportion of children under 5 to women of child-bearing age in the Negro and in the white population is shown by states for the years 1910 and 1900 on Maps I to IV (pp. 291, 292). An extremely significant feature of these maps—in the case of each population class, but specially in the case of Negroes—is the remarkable decrease, in 1910 as compared with 1900, in the aggregate black area, *i. e.*, in the area representing states in which the proportion of children to women exceeded 600 children under 5 to 1,000 women 15 to 44. In the case of Negroes in 1900, this area included all of the "black belt" states, constituting a solid band of states from North Carolina to Texas; and in 1910 only 2 states, North and South Carolina. For whites the area representing a ratio of 600 children to 1,000 women included 20 states—14 Southern and 6 Northern and Western—in 1900, and 15 states—13 Southern and 2 Northern and Western—in 1910. Comparison of the hachures on the maps for the two years makes apparent the general decrease in the proportion of children in areas of low as well as of high proportion. In the case of Negroes this is strikingly apparent in the extension of the white area, in 1910 as compared with 1900.

URBAN AND RURAL POPULATION.

A tabulation relating to the proportion of children in the population living in urban communities of 25,000 or more inhabitants in 1910, and in the population living in smaller urban communities and rural districts, is summarized in Table 9 by geographic sections. Similar data are given, by states and geographic divisions, in Table 12 (p. 295).

The classification of Table 9 does not, it will be noted, distinguish the urban from the rural population, since in this table all of the urban population which in 1910 lived in communities of less than 25,000 inhabitants is classified with the rural population, giving an aggregate population living outside cities of 25,000 inhabitants which is partly urban and partly rural. Since, however, the population living in cities of 25,000 or more inhabitants is entirely urban, and the population living outside such cities is predominantly rural, the differences in the proportion of children between the two aggregates distinguished in Table 9 may be accepted as generally characteristic of differences obtaining between the urban and rural

Although the ratio of children under 5 to women 15 to 44 was higher in the Negro population as a whole in 1910 than it was in the white population—being 519 per 1,000 for Negroes, as compared with 484 for whites—it was lower for Negroes than for whites in each of the nine geographic divisions, and with exception of two states—Maryland and North Carolina—lower for Negroes than for whites in each state. The explanation of this apparent inconsistency of the ratios for the divisions and states with the ratios for

NEGRO POPULATION.

aggregates. It is perhaps fair to assume that the ratio of children shown for the population living outside cities of 25,000 or more inhabitants is somewhat below the ratio obtaining in the purely rural population, and that the ratio shown for cities of 25,000 and over is somewhat below the ratio obtaining in the urban population as a whole.

The West.....	5,380	912,764	1,452	484,111	270	530

The general significance of the differences developed in Table 9 is not materially affected by the exclusion of small cities from the urban group. The table indicates clearly that the proportion of children is much lower in cities than it is in rural communities. The number of children under 5 per 1,000 women 15 to 44 in the Negro population of cities of 25,000 or more inhabitants in 1910 was 239 in the country as a whole, 248 in the South, 225 in the North, and 207 in the West; in the Negro population living outside such cities the corresponding number was 596 in the country as a whole, 609 in the South, 383 in the North, and 270 in the West.

The most marked difference developed in the table is that between the proportion of children in the Negro population of southern cities of 25,000 and over and the Negro population in the South outside such cities, the number of children per 1,000 women being for the population of the cities 248 and for the balance of the population, urban and rural, 609. In the North and in the West the corresponding differ-

ence is much less marked, the proportion for the population living outside of cities of 25,000 and over being very much lower in the North and West than it is in the South. In the case of the white population, also, the most marked difference in proportions as developed in Table 9 is that obtaining in the South, where the number of children per 1,000 women was 360 for the white population living in cities of 25,000 and over and 665 for the population living in the South outside such cities.

In each section of the country, in the population living in and living outside cities of 25,000 or more inhabitants, the proportion of children in 1910 was higher for whites than for Negroes. In the aggregate for the United States of population living outside cities of 25,000 or more, however, the ratio was higher for Negroes, the explanation of the seeming inconsistency of the ratios for sections with ratio for the total of this aggregate being—as in the case noted above of state and divisional ratios—that the high ratio of the South is heavily weighted in the aggregate for Negroes

URBAN COMMUNITIES.

Data relating to the proportion of children in the Negro and white population in 1910 and in 1900 are given in Table 10 for the 39 cities of 25,000 or more inhabitants in 1910, which reported in that year a Negro population of 10,000 or more. In this group of selected cities the number of Negro children under 5 per 1,000 Negro women, 15 to 44 ranged in 1910 from 153 in Kansas City, Mo., to 363 in Wilmington, N. C.

In 30 of the 39 cities shown in Table 10 the ratio of children to women in the Negro population decreased in the decade 1900-1910, and in 3 it increased, comparable data covering the two years 1910 and 1900 not being available for the 6 remaining cities.

In each of the 39 cities, without exception, the proportion of children was lower in the Negro than it was in the white population.

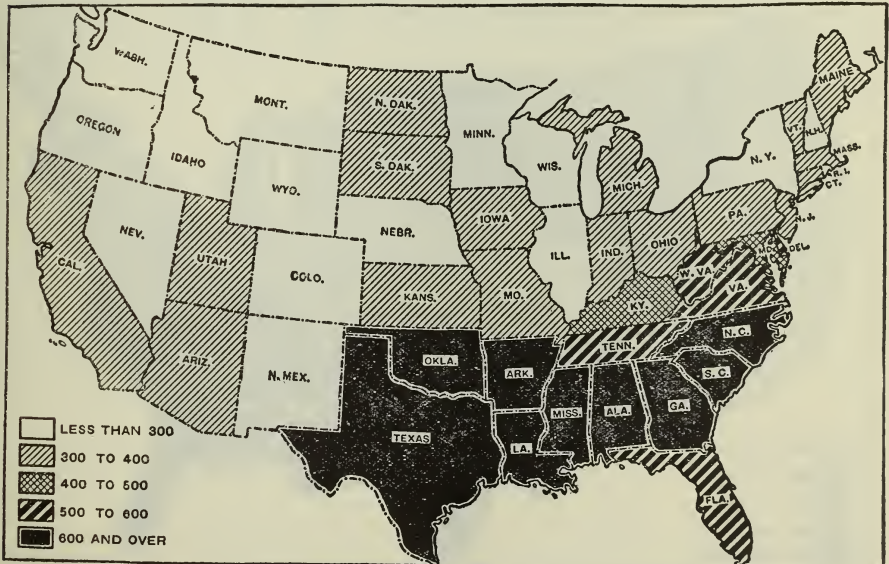

In Table 13 (p. 296) statistics are given for each city of 25,000 or more inhabitants in 1910, showing the number of Negro women 15 to 44, of Negro children under 5, and for those cities in which the number of women 15 to 44 was 1,000 or more, the number of children per 1,000 women.

FERTILITY,

MAP I.—NEGRO CHILDREN UNDER 5 YEARS OF AGE TO 1,000 NEGRO WOMEN 15 TO 44, BY STATES: 1910.

MAP II.—NEGRO CHILDREN UNDER 5 YEARS OF AGE TO 1,000 NEGRO WOMEN 15 TO 44, BY STATES: 1900.

FERTILITY.

TABLE 10.—WOMEN 15 TO 44 YEARS OF AGE, CHILDREN UNDER 5 YEARS, AND NUMBER AND INCREASE OR DECREASE OF CHILDREN PER 1,000 WOMEN, BY CITIES OF 25,000 OR MORE INHABITANTS HAVING IN 1910 A NEGRO POPULATION OF 10,000 OR MORE: 1910 AND 1900.

CITY.	WOMEN 15 TO 44 YEARS OF AGE.				CHILDREN UNDER 5 YEARS OF AGE.				CHILDREN UNDER 5 PER 1,000 WOMEN 15 TO 44 YEARS OF AGE.				Increase (+) or decrease (-): 1900-1910.

CHAPTER XIV.—MORTALITY IN THE REGISTRATION AREA.

DECENNIAL CENSUS MORTALITY STATISTICS: 1850-1900.

At each decennial census, 1850 to 1900, mortality data were collected upon a separate mortality schedule, calling for a return in the case of each person who had died during the twelve months preceding the date of enumeration. On this schedule were specified to be returned for each decedent, detail of color, sex, age, marital condition, nativity, parentage (1870-1900), occupation, month in which death occurred, cause of death, number of days ill (1850, 1860), length of residence in county (1850-1900), name of place where disease was contracted (1880, 1890), name of attending physician (1880-1900), whether insane or idiot (1880, 1890), and whether a Union or Confederate veteran (1890).

The census of 1850 secured returns of 52,566 deaths in the slave population, giving a rate 16.4 per 1,000 population enumerated. Deaths in the free population, including the free colored, which were not distinguished from the white deaths, numbered 270,706 giving a rate of 13.5 per 1,000. In the Compendium of the 1850 census (p. 105) the opinion is expressed that "the true number of deaths in the Union for 1850, considering it a sickly year, could not have fallen short of one in every fifty persons for all classes, which would swell the total deaths of the census from 323,272 to 463,839." It is thus assumed that omissions of deaths amounted to 140,000, and the statement is made that "in regard to the number of deaths, the returns of the census are not likely to deceive any one, since an attempt to reason from them would exhibit a degree of vitality and healthfulness in the United States unparalleled in the annals of any nation." (p. 58.)¹

At each subsequent census the incompleteness of the mortality data was obvious in the returns, and freely admitted in the reports. Some value attached to the data as indicating the principal causes of death, but practically no value attached to the returns as providing data for determining mortality rates.

At the censuses of 1880, 1890, and 1900, the mortality schedule was withdrawn from enumerators in certain areas—comprising in 1880 the states of New Jersey and Massachusetts, and restricted areas in other states, and in succeeding census years a somewhat more extended area, (see maps on page 301)—and for

¹ It is interesting to find expressed in the Compendium of 1850, which published the results of the first effort to gather mortality data at the decennial census, the opinion that "nothing short of a registration system in the states can give the required data (relative to births, marriages, and deaths) satisfactorily," since "people will not, or can not, remember and report to the census taker the number of the facts, and the particulars of them which occur in the period of a whole year to 18 months prior to the time of his calling."

these areas the return of mortality was made up from records in registration offices.

The return of deaths from these designated areas within which local registration records were accepted, and no direct enumeration of deaths undertaken, were much more complete than the returns in the areas secured by enumerators on the mortality schedule.

This will be apparent from the summary of mortality returns for the year 1900, as given in Table 1. In the area of death registration the number of Negro deaths per 1,000 population was 30.2, and in the area of death enumeration 13.7, the corresponding figures for the white population being 17.3 and 10.6.

Table 1

AREA.	CENSUS OF 1900.			
	Negro population June 1, 1900.	Deaths in year ending May 31, 1910.		
		Negro.		White per 1,000 population.
		Number.	Per 1,000 population.	
United States.....	8,833,994	140,934	16.0	13.4
Area of death registration.....	1,180,546	35,710	30.2	17.3
Area of death enumeration.....	7,653,448	105,224	13.7	10.6

There is no reason to believe that the true death rate in 1900 was higher in the area of death registration than in other sections of the country. The excess of the rate within the area of registration, over the rate outside of this area, represents with approximate accuracy omissions in the returns made by enumerators.

It will be obvious that the mortality returns of the decennial censuses, 1850-1900, are incomparable with the data collected annually for the registration area beginning with the calendar year 1900, and in the following tables no attempt is made to relate this earlier data to the data of the annual reports of mortality statistics.

DECENNIAL MORTALITY OF THE NEGRO AND NATIVE WHITE POPULATION CLASSIFIED BY AGE: 1900-1910.

The age classification of the population as returned at the several censuses provides a rough measure of mortality in the country as a whole, and is in fact the only index of mortality embracing the entire Negro population.

Since the Negro population is almost entirely native, and little affected by immigration, some inferences may be drawn from a comparison of the age groups as determined at successive censuses. This

comparison is made in Table 2, for the two censuses 1900 and 1910. The assumption underlying the table is that survivors in 1910, of the population enumerated in 1900, would be in specific age groups—that, for example, the Negro population returned in 1910 as being 10 to 19 years of age, embraced all survivors of the Negro population returned in 1900 as being under 10 years of age, that the population 20 to 29 in 1910 embraced survivors of those returned in 1900 as 10 to 19, and similarly of each other age group shown in Table 2. The further assumption is made—which

seems warranted in the case of the Negro population, although a similar assumption would not be warranted as regards the aggregate white population—that the decrease during the decade 1900-1910, in the number enumerated as, for example, under 10 in 1900, and 10 to 19 in 1910, is due to mortality, and is not affected materially by net immigration or emigration. Similar assumptions may be made regarding the native white population for which class data are given in Table 2 in comparison with data for Negroes.

DECENNIAL MORTALITY OF NEGRO AND WHITE POPULATION, BY AGE PERIODS: 1900-1910.

It appears in Table 2 that the aggregate decrease by mortality during the decade 1900-1910 in the population enumerated in 1900 amounted in the case of the Negro population to 741,080, or 17 per cent, and in the case of the native white population to 2,836,133, or 9.9 per cent. Comparing the population enumerated in 1900 as under 10 years of age, with the population enumerated in 1910 as 10 to 19 years of age, the decrease amounted in the Negro population to 118,878, or 9.9 per cent, and in the case of the native white population to 301,320, or 3.9 per cent. Comparing the age groups 10 to 19 and 20 to 29, the percentage decreases amounted for Negroes to 11.6 and for native whites to 4.7. The corresponding rates for the age groups 20 to 44 and 30 to 54 are 15.6 for Negroes and 8.7 for native whites; for the age groups 45 to 64 and 55 to 74 they are 35.9 for Negroes and 22.6 for native whites, and for the age groups 65 and over and 75 and over they are 67 for Negroes and 63.9 for native whites.

These rates should be carefully distinguished from the mortality rates shown in other tables for the Negro population. The decennial mortality rate given in Table 2 does not relate the number of deaths during

the decade 1900-1910 to the mean population of the decade or to the population at the beginning of the decade. The total number of deaths occurring in the Negro population during the decade can not be determined from any data available, since these deaths include the deaths of children born subsequently to the census of 1900 and dying prior to the census of 1910. For any age group the decrease by mortality in a period of 10 years is a specific and peculiar rate, which, although it is capable of reduction to an average annual rate of mortality, is not even when so reduced comparable with an annual death rate per 1,000 population.

Very considerable significance does, however, attach to the comparison made in Table 2 of the decennial mortality of Negroes with the decennial mortality of native whites. It is apparent that the entire Negro population during the decade 1900-1910 suffered a mortality greatly in excess of that shown by the native white population.

The causes of the excessive mortality of the Negro population could not be determined from the mortality data except by inferences based upon a much more detailed analysis of these data by small areas and

specific causes of death than can be undertaken in a general report. Even such an analysis, however detailed and searching, would leave room for speculation regarding the precise influence upon mortality of varying factors of environment, economic status, and racial character. It may be pointed out, however, that the inference certainly is not in any degree warranted by the data that the differences in mortality between Negroes and other classes are racial or natural differences in the sense that they would persist under different environmental and economic conditions for these classes. Until the contrary fact is established, the probability is rather, on the contrary, that the differences in mortality represent environmental factors, which may be remedied by gradual improvement in the social, economic, and hygienic status of the Negro population.

That such improvement shall be achieved is unquestionably of vital importance to the Negro race, and there is no obvious reason why it should not be rapid and complete, provided a concerted and persistent social effort on the part of the Negro race is made for its achievement. Substantial improvement in mortality may be designated as a social obligation resting upon the Negro population, although responsibility for the excessive mortality in this class undoubtedly rests in some degree upon the community as a whole.

THE REGISTRATION AREA FOR DEATHS: 1900-1915.

Beginning with the year 1900, data relating to mortality have been compiled from records of deaths annually for those states and cities which provide by state law or municipal ordinances for the proper registration of deaths and furnish the Census Bureau with transcripts of death records covering in the estimation of the bureau (based upon such evidence as is available) at least 90 per cent of all deaths occurring. These states and cities in the aggregate constitute the registration area for deaths.

In 1915 the area included 25 states, the District of Columbia, and 41 cities in nonregistration states, and embraced two-thirds (67.1 per cent) of the total population of the country. In 1900 the registration area, as determined by an examination of mortality returns at the Twelfth Census, embraced 10 states, and 153 cities in other states. The extension of the area during the period 1900-1915, as will be apparent from the maps on page 301, has been largely confined to the northern and western sections of the country, although three Southern states—Kentucky, Maryland, and Virginia, and municipalities of 1,000 or more population in North Carolina, together with 30 cities in nonregistration Southern states, were included in the area as defined in 1915. Kentucky and Virginia have been admitted to the area since 1910. The maps on

the following page for 1880 and 1890 indicate registration states at the decennial censuses for these years.

During the entire period 1900-1915, the great mass of the Negro population has been resident in the non-registration area. The proportion living in the registration area was only 13.5 per cent in 1900, 19.7 per cent in 1910, and 30.4 per cent in 1915. It will be obvious that statistics of deaths for the census years 1900 and 1910—for which years only are population figures available—are as regards the Negro population, very incomplete.

It may be noted further that the Negro population of the registration area is largely an urban population. This results from the fact that the Negro population of the Northern registration states is largely urban, while generally throughout the South only cities are included in the registration area. A small rural population in the North and West is included in the area, but the large rural population in the South is almost entirely excluded.

In Table 3 the Negro population in the registration area and in the nonregistration area is given, by sections and southern divisions, for the three years 1900, 1910, and 1915, with percentage distributions of these populations, by geographic areas.

1900.....	30,254	11,495	44.6	18,759	0.3	1.1	0.2

¹ The percentages for 1915 are figured upon the 1910 populations of the registration and nonregistration areas as defined in 1915. The percentages indicated in the effect of the extension of the registration area between 1910 and 1915, on the assumption that the Negro increase in this period was at the same rate in the registration area as in the nonregistration areas.

² Population in 1910 of areas as defined in 1915.

GROWTH OF THE REGISTRATION AREA FOR DEATHS: 1880-1915.

Note.—In addition to the registration states (shaded in the cartograms) the registration area included certain cities in nonregistration states.

Of the Negro population resident in the South in 1910, numbering 8,749,427, only 1,066,246, or 12.2 per cent were included in the registration area. By extensions of the area since 1910, this proportion has been increased to approximately 22.8 per cent in 1915, leaving over three-fourths of the Negro population of the South still outside the area. The proportion in the registration area in the North in 1910 was 80.4 per cent, and in the West 85.2 per cent. These proportions have been increased by extensions since 1910 to approximately 92.6 and 85.2 per cent. In 1910, 55.1 per cent of the Negro population of the registration area was resident in the South, and 97.4 per cent, or practically the entire Negro population of the non-registration area.

Table 30 (p. 322) gives data, by states, similar to that shown in Table 3, by sections and southern divisions, showing for each geographic division and state the Negro population of the registration area and of the nonregistration area in 1900 and in 1910.

VALUITY OF THE MORTALITY DATA FOR THE REGISTRATION AREA.

The incompleteness of the mortality data as regards the Negro population is apparent in the foregoing table (Table 3), which shows that less than one-fifth of this class of the population was included in the area of registration in 1910, and that the proportion in 1915 was less than one-third. It will be obvious that very considerable uncertainty must attach to the calculation of death rates for any years other than the years of census enumeration, since such calculations necessarily involve estimates of Negro populations resident in the several urban and state areas of death registration. In the case of any single urban community or state, and even in the case of the registration area as a whole, such estimates for the Negro population may be seriously in error, in consequence of the migratory shiftings of the Negro population and of the varying rates of growth of urban communities, the calculation of death rates must, therefore, be generally restricted to the years 1900 and 1910, in which years, respectively, only 13.5 and 19.7 per cent of the Negro population was included in the area of death registration.

It should be pointed out further that only the larger and more persistent characteristics of mortality can be accepted as established, where specific death rates are figured by sex, age, and cause of death within the area of registration, since the returns of deaths and of population are probably less complete and accurate in the case of Negroes than they are in the case of whites.

Finally comparisons of one year with another are made difficult by changes in the extent of the area of registration.

The classifications of deaths by sex, age, and cause, since it does not involve a relation of deaths to population, may be extended to other years than those of census enumeration, and in general it may be noted that the value of such classifications may not be se-

riously impaired by a considerable degree of incompleteness in the returns.

ANNUAL DEATHS: 1900-1915.

Table 4 gives the number of deaths in the registration area each year, 1900-1915.

¹ A minus sign (-) denotes decrease. ² Includes colored other than Negro.

The total number of deaths in the registration area in 1915 was 909,155. Of these, 74,363, or 8.2 per cent, were Negro; 831,181 were white; and 3,611 were colored other than Negro.

DEATHS CLASSIFIED BY SEX AND AGE OF DECEDENT.

Table 5 gives the distribution per 1,000 of Negro deaths, classified by sex and age. The total number of deaths at all ages in 1915 among Negro males was 38,567. Of these deaths, the number occurring in the age under 1 year, per 1,000 at all ages, was 157; in the age 1 year, 35; and in the age 2 years, 14. The proportion under 1 decreased from 239 per 1,000 deaths at all ages in 1900, to 196 in 1910, and was less in 1915 than in any of the preceding years, 1910-1914. A larger proportion of male than of female deaths, 157 per 1,000 as compared with 139 per 1,000 in 1915, were in the age under 1 year.

Of the total deaths at all ages, the proportion occurring in the ages under 25 years has tended to decline during the period covered by Table 5. Among males the proportion in the adult ages 25 to 44 years increased from 227 per 1,000 in 1900 to 277 per 1,000 in 1915; the proportion in the ages 45 to 64 increased from 169 to 229; and the proportion in the ages 65 to 84 from 77 to 121. Similar increases are shown for females.

These changes indicate marked improvement as regards mortality, but it must be borne in mind that the data for the several years represent different areas, the registration area in 1915 being, especially as regards the Negro population, much more extensive than the area in 1900, or even in 1910.

¹ Less than 1.

From Table 6 it appears that the proportion of white deaths under 1 year of age in 1915 exceeded the corresponding proportion in the Negro population, the number of deaths under 1 per 1,000 deaths at all ages being 165 for whites and 148 for Negroes. In 1900 the proportion for Negroes of 226 per 1,000 ex-

ceeded that for whites of 206 per 1,000. A larger proportion of Negro than of white deaths was in each of the age periods 10 to 54 years, and a larger proportion of white than of Negro deaths in the more advanced age periods.

NEGRO POPULATION.

Table 6 is partially illustrated by Diagrams I and II, on the following page, which show for combinations of the age periods of Table 6, the distribution of Negro deaths in 1915 in comparison with 1900 (Diagram I), and in comparison with the distribution of white deaths in 1915 (Diagram II).

DIAGRAM I.—NEGRO DEATHS AT AGE SPECIFIED, PER 1,000 DEATHS AT ALL AGES, IN THE REGISTRATION AREA: 1915 AND 1900.

In Diagram I the barred area indicates the shifting in the proportion of deaths, which has reduced the proportion of deaths in the ages under 25 and increased the proportion in the ages 25 and over. The barred area in Diagram II indicates the relatively high proportion of Negro, as compared with white deaths in the middle ages of life, especially in the years 25 to 44.

GENERAL DEATH RATE: 1910 AND 1900.

The general death rate of the Negro population of

the registration area for the calendar year 1910 was 25.5, this being the number of Negro deaths during the calendar year 1910 per 1,000 Negro population on July 1, as estimated upon the basis of the census enumeration of April 15, 1910.

In 1900 the general death rate for the Negro population of the registration area as defined in that year was 29.4 per 1,000 population. The number of deaths occurring was, therefore, 3.9 less per 1,000 population in 1910 than in 1900.

DIAGRAM II.—NEGRO AND WHITE DEATHS AT AGE SPECIFIED, PER 1,000 DEATHS AT ALL AGES, IN THE REGISTRATION AREA: 1915.

The 1910 death rate of 25.5 represented 49,499 Negro deaths, and a Negro population of 1,943,969; the 1900 rate of 29.4 represented 34,995 deaths and a Negro population of 1,189,023. While the decline of 3.9 in the death rate can not be taken as an accurate index of improvement in mortality, since the areas compared are not identical, it will be noted that the 1910 rate represents, as compared with the 1900 rate, a larger proportion of the total Negro population. The improvement in mortality during the decade within and without the area of registration may have been greater or less than the improvement indicated by the decline in the death rate as calculated for the different registration areas of the two years. Since

the rate in each year represents a population that is largely urban, it probably exceeds the true death rate in the Negro population as a whole.

Table 7 gives the population and mortality figures for the Negro and white population of the registration area in the two census years 1910 and 1900. In both these years the rate for Negroes greatly exceeded the rate for whites, the excess of the Negro over the white rate amounting in 1910 to 10.9 (the difference between the rate for whites of 14.6 and the rate for Negroes of 25.5), and in 1900, to 12.3 (the difference between 17.1 and 29.4). The excess of the Negro over the white rate was thus somewhat less in 1910 than the excess in 1900.

COMPARISON OF NEGRO DEATH RATE WITH RATE FOR OTHER CLASSES: 1910.

In Table 8 the number of deaths per 1,000 population in each race, nativity, and parentage class is given for 1910. The rates in this table are figured upon the populations in each class as enumerated on April 15, 1910, no estimates for July 1 being undertaken in detail by classes. The rates for Negroes and whites and for all classes combined are not materially affected by this slight change in the population base, as may be seen by comparison of Table 8 with Table 7, the rate for Negroes in 1910, for example, being 25.5 in Table 7 and 25.7 in Table 8.

CLASS OF POPULATION.	REGISTRATION AREA: 1910. ¹		
	Population April 15, 1910.	Deaths: Calendar year 1910.	
		Number.	Per 1,000 population.
All classes	53,409,475	801,735	15.0
Negro	1,866,407	47,989	25.7
White	51,331,794	751,121	14.6
Native	39,908,911	554,417	13.9
Native parentage	24,654,457	353,082	14.3
Foreign parentage	10,667,210	148,456	13.9
Mixed parentage	4,587,244	52,879	11.5
Foreign born	11,422,883	196,704	17.2
Indian, Chinese, Japanese, and all other	211,274	2,625	12.4
Indian	80,236	886	11.0
Chinese	63,960	1,055	16.5
Japanese	64,419	664	10.3
Other	2,629	20	7.6

¹ Except cities in North Carolina of less than 10,000, for which population data in detail by classes shown are not available.
² Includes unknown nativity.
³ Includes unknown parentage.

Considerable allowance must be made for the possibility of error in the data for the several parentage classes—error in the return of parentage for population and for deaths, and error resulting from the distribution of population and deaths of unknown parentage. Comparisons of Negroes and white classes with the Chinese and Japanese are of little significance, owing to the abnormal age distribution of the Chinese and Japanese, and comparison of natives with the foreign-born whites also in a lesser degree

are invalidated by differences in the age composition of the several classes. Finally, it is not improbable that a larger proportion of Indian than of other deaths escape registration, with the result that the Indian death rate is depressed relatively to rates for other classes.

The most significant comparison in Table 8 is that between Negroes and native whites, which show death rates, respectively, of 25.7 and 14.6. A further analysis of the data is, however, required to separate so far as possible the urban from the rural elements in these classes. [See sections on urban and rural mortality (p. 315), and mortality by registration cities (p. 320).]

COMPARISON WITH RATES FOR FOREIGN COUNTRIES: 1800-1910.

The general death rate of the Negro population in the registration area is given in Table 9 in comparison with the annual average death rate for the aggregate populations of foreign countries, the annual averages for foreign countries being figured by decades covering in so far as data are available the period from 1800 to 1910.

In this table the countries are listed in order according to their death rate in the year 1910. The rates for this year range from 9.7 in New Zealand, to 33.3 in Mexico. Only 4 of the countries listed (Ceylon, Russia in Europe, Chile, and Mexico) show for this year (1909 in the case of Russia), rates higher than that for the Negroes of the registration area.

In comparatively recent decades, however, the rates for these foreign populations have, in a number of cases, approximated closely or exceeded the 1910 Negro rate of 25.5. The Netherlands, with a 1910 rate of 13.6, shows for the decade 1861-1870 an average rate of 25.4, and for the two preceding decades 25.6 and 26.2, respectively. Belgium, with a 1910 rate of 15.2, shows for the decade 1861-1870 an average of 24.4 and for the three preceding decades averages of 22.5, 24.3, and 25.9, respectively. Germany, with a 1910 rate of 16.2, shows for the decade 1881-1890 an average of 25.1 and for preceding decades averages of 27.2, 26.9, 26.4, 26.8, 28.8, and 26.7. Finland, with a 1910 rate of 16.5, shows for the decade 1861-1870 an average of 32.2, the rates for preceding decades being 28.7, 23.5, 28.2, 24.9, 26.4, and 31.9. France, with a 1910 rate of 17.8, shows for the decade 1881-1890 an average of 22.1 and for preceding decades rates ranging from 23.7 to 26.1. Italy, with a 1910 rate of 19.9, shows for the decade 1891-1900 an average 24.2 and for preceding decades averages of 27.3 and 29.9. Austria, with a 1910 rate of 21.3, shows averages ranging from 23.3 in the decade 1901-1910 to 33.2 in the decade 1841-1850. Serbia's decennial averages range from 23.3 to 34.3; Spain's

NEGRO POPULATION.

from 25.2 to 31.7; the two decades shown for Bulgaria give averages of 23.2 and 26; the three decades shown for Hungary give averages of 25.7, 29.9, and 32.5; and in Roumania the averages range from 25.8 to 31.3. Very generally in these countries the death

rate has been materially reduced in recent decades from averages exceeding the Negro rate, and the assumption may fairly be made that the present high mortality of the Negro population may be similarly reduced.

⁹ For the period 1862-1870.

¹⁰ For 1900.

SPECIFIC MORTALITY BY SEX AND AGE PERIODS:
1910 AND 1900.

Table 13 gives for the aggregate population of the registration states the specific mortality rates in the Negro and white population classified by sex and age for the two years 1910 and 1900. The tabulation does not cover the registration areas in the non-registration states, the age classification by sex and racial class being available for only a portion of these areas. Tables 10, 11, and 12 are derived from Table 13, and are partially illustrated by Diagrams III, IV, and V (p. 309)—Diagram III relating to Negro deaths in the year 1910 only; Diagram IV, to Negro deaths in 1910 and 1900, both sexes combined; and Diagram V, to Negro and white deaths, both sexes combined, in 1910. The tables thus carry figures

for whites and for 1900 not shown in the diagrams, and show figures for males and females separately, which are shown on the diagrams only for the two sexes combined.

In Table 10 a comparison is made of the specific mortality rates for males with the corresponding rates for females. In the Negro population under 1 year of age in 1910 the number of deaths per 1,000 among males (280.3) exceeded the number for females (243.2) by 37.1, the corresponding excess for 1900 being 70.3. In 1910 white male deaths per 1,000 population under 1 exceeded female by 27.8.

In the Negro population at each age, except the age 10 to 14, 15 to 19, and 85 and over, the number of male deaths per 1,000 exceeded the number of female deaths. In the white population the mortality rate

for males exceeded that for females at each age shown in Table 10.

Age unknown.....	13.5	7.2	6.3	6.6	3.4	

In the male and female Negro population under 1 year of age, 1 to 4 years, 5 to 9 years, 10 to 14 years, 15 to 19 years, and 65 to 84 years, the number of deaths per 1,000 living in these ages in 1910 was less than the number in 1900. In other words, these several age groups showed improvement as regards mortality for the decade 1900-1910. Among both males and females the mortality rate for the ages 25 to 44 and 45 to 64 was slightly higher in 1910 than in 1900. In the population 85 and over the rate for males decreased and the rate for females increased. The white population, both male and female, shows improvement in mortality at each age. Changes in the specific mortality rates are given in Table 11 and are illustrated for Negro deaths without distinction of sex in Diagram IV (p. 309).

The excess of Negro over white deaths per 1,000 living at each age in the registration states is shown in Table 12. In 1910 and in 1900, among both males and females, at each age, excepting the age 85 years and over, Negro mortality exceeded white mortality. In the younger ages generally the excess was less in 1910 than in 1900, but in the ages 25 to 44, and 45 to 64, it was greater in 1910 than in 1900. By reference

to Table 13 it will be seen that in these ages mortality decreased slightly in the white population and increased in the Negro population.

Table 11 DEATHS IN THE REGISTRATION STATES PER 1,000 POPULATION AT AGE SPECIFIED.

Age unknown.....	5.5	5.7	19.3	28.3

In the case of Negro males 25 to 44 years of age the increase in mortality was not inconsiderable, the change being from 13.9 in 1900 to 17.2 in 1910. The rate for white males of this age decreased from 9.3 in 1900 to 8.1 in 1910. These changes are given in Table 12, the 1910 figures for both sexes combined being illustrated in Diagram V.

MORTALITY.

DIAGRAM III.—NEGRO DEATHS AT AGE SPECIFIED, PER 1,000 LIVING AT THAT AGE IN THE REGISTRATION STATES, BY SEX: 1910.

DIAGRAM IV.—NEGRO DEATHS AT AGE SPECIFIED, PER 1,000 LIVING AT THAT AGE IN THE REGISTRATION STATES: 1910 AND 1900.

DIAGRAM V.—NEGRO AND WHITE DEATHS AT AGE SPECIFIED, PER 1,000 LIVING AT THAT AGE IN THE REGISTRATION STATES: 1910.

NEGRO LIFE TABLE.

Life tables have been compiled for the Negro population, one for Negro males and one for Negro females, and are reproduced as Tables 31a and 31b, (pp. 323 to 326) of this report. Selected years and columns from these tables are given in Table 14, which embraces also comparable data for white males and females.

Where adequate data are available, the life table constitutes an accurate measure of mortality for any population class, the data required for the calculation of a life table being accurate statistics of deaths and of population, by sex and age.

In the case of the Negro population as a whole these data are not available. The Negro life tables are, therefore, necessarily based upon data relating to selected areas, namely, those areas for which approximately accurate and complete mortality and population statistics are available.

Specifically the areas represented by the Negro life tables are the 10 original registration states,¹ and the District of Columbia. These states are all Northern states, the only southern area included being the District of Columbia.

The estimated Negro population of this area on July 1, 1910, was 463,698, the number of males being 223,884, and the number of females 239,814. The number of deaths reported for this population in the three years 1909, 1910, and 1911 was 17,471 for males and 15,853 for females.

The calculation of the Negro life tables involved a relation of male and female deaths, classified by single years of age—and in the case of deaths under 1 year, by months of age—to the number of males and females living in each age. By this relationship a refined

¹Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, and Michigan.

NEGRO POPULATION.

DIAGRAM VI.—LIFE TABLE DISTRIBUTION, BY AGE AND SEX, OF THE NEGRO AND WHITE POPULATION—NUMBER LIVING AT AGE SPECIFIED IN A STATIONARY POPULATION SUSTAINED BY 100,000 BIRTHS OF EACH SEX EQUALLY DISTRIBUTED THROUGHOUT EACH YEAR (COLUMN L_x OF THE LIFE TABLE) WITH EXCESS OF NEGRO FEMALES OVER NEGRO MALES, AND EXCESS OF WHITES OVER NEGROES AT EACH AGE.

mortality rate is determined for each year (or month) of age. Prior to the calculation of these rates, however, inaccuracies in the age returns are eliminated by correcting the age distribution of the population to make it conform to a normal distribution. The mathematical processes employed in correcting the age distribution need not be considered here in detail. The effect produced upon the age distribution of the population may be easily comprehended by comparing the age diagram on page — with that above. One of those diagrams represents the distribution of the total Negro population according to returns of sex and age, and the other the sex and age distribution of the Negro

life table population in comparison with that of the white life table population. The effect resulting from correction of the age distribution is elimination of the concentrations in the adult population upon ages ending in 0 and in 5, and of other irregularities of distribution, especially in the younger ages. By the application of formulas, which have been scientifically determined, an age distribution of the population is produced which undoubtedly conforms closely to the actual age distribution of the population represented by the age returns.

When for any given year or series of years the mean number living in each age and the number of

deaths occurring annually in each age has been accurately determined, the specific mortality rates for each year of age are found by dividing the number of deaths by the population living in that age.

When these rates have been determined, it is possible to construct the life tables showing survivorship and expectation of life for each age.

The Negro life table for males shows (1) the number surviving to each age in 100,000 male children born alive; (2) the number dying in each year (or month) of age in 100,000 male children born alive; (3) the rate of mortality, or number dying in each age interval per 1,000 alive at the beginning of the age interval; (4) the expectation of life, or average number of years to live at each age; and (5) the age composition and specific mortality indicated for a stationary male population maintained by 100,000 male births each year (columns 6, 7, 8, and 9 of Table 31a).

Table 14 is restricted to those columns of the life table which show number of survivors to each age in 100,000 born alive, number of deaths in each age, specific rate of mortality, and expectation of life. These data are given for selected years of age. The

table shows, for example, that in 100,000 Negro male children born alive, 78,065 survive the first year of age, the corresponding number for females being 81,493, and for white males and females 87,674 and 89,774, respectively. In 100,000 Negro male children born alive, 21,935 die under 1 year of age—that is to say, before completing 1 year of age; the corresponding number for Negro females being 18,507, and for white males and females, 12,326 and 10,226, respectively. These numbers indicate a mortality rate, or number of deaths in the first year of age per 1,000 children born alive, of 219.35 for Negro males, 185.07 for Negro females, 123.26 for white males, and 102.26 for white females. The expectation of life at birth indicated in the life table is 34.05 years for Negro males, 37.67 years for Negro females; 50.23 years for white males and 53.62 for white females.

The expectation of life in the case of children who survive to the exact age of 1 year is increased in the case of Negro males from 34.05 years, the expectation at birth, to 42.53 years, and in the case of Negro females from 37.67 to 45.15 years.

Among Negro children, male and female, expectation of life increases during the first 3 years of life to 45.01 years at the exact age of 3 years for Negro males, and 47.12 years for Negro females. Among white children expectation of life increases during the first 2 years of life to 58.88 years for white males arrived at the exact age of 2 years, and to 59.24 years for white females. This increase in the expectation of life over expectation at birth develops in proportion as the initial period of excessive mortality is passed. Children who have survived the excessive mortality of the first 2 or 3 years of life obviously have a greater chance of surviving to maturity and old age than they had at birth. In subsequent ages expectation of life necessarily decreases with advancing age, although expectation of life does not decrease in any fixed proportion to advancing age.

SURVIVAL OF INFANCY AND ADOLESCENCE.

As regards Negro and white males and females, the figures given in Table 15, showing the number of survivors to the age 1 year and to the age 20 years in 1,000 children born alive, are taken from the life tables prepared by the Bureau of the Census. The figures for the male population of foreign countries are reproduced from the official publication of the French Government to which reference is made in the table. In this table the foreign countries are arranged in order according to the number of survivors to the age 1 year in 1,000 male children born.

¹ The 10 original registration states and the District of Columbia.

² Statistique internationale du mouvement de la population, Vol. II, pp. xix-xx.

It will be noted that survivorship to full maturity is very largely determined in the first year of age. In the Negro population the number of survivors to the age 1 year in 1,000 males born alive, is 781, giving a mortality for the first year of age of 219 per 1,000 born. In the age period of 19 years, from the exact age 1

year to the exact age 20 years, the number of survivors is reduced to 614 or by 133. The mortality spread over these 19 years is, therefore, less in the aggregate than the specific mortality in the first year of age, i. e. the age "under 1 year," and this is true of white males and of females, Negro and white. It is true, also, of males in foreign countries, excepting Sweden and Norway, that the mortality in the first year of age exceeds the mortality in the 19 succeeding years of childhood and adolescence. In Germany, for example, in the period of 20 years 1891-1910, the average mortality per 1,000 male children born was 218 in the first year of age, and 103 in the age period 1 to 19 years inclusive; and in Austria-Hungary, in the two years 1900-1901, the mortality for the first year of age was 242, and for the succeeding period of 19 years, 143.

DURATION OF MATURITY AND OF OLD AGE.

The average number of years lived in the productive ages 20 to 60 years, for all children born, and for survivors to the age 20 years, is shown in Table 16, and the average duration of old age or average expectation of life at the age of 60 years, in Table 17, data for foreign male populations being taken from the source cited above.

In 1,000 children born a certain number on the average—among Negro males the number is 237—survive to the age 60 years, and for these children the duration of maturity, defining maturity as the life period between the exact ages 20 and 60 years, is 40 years; a certain number in 1,000 children born—among Negro males, 386—do not survive to the age 20 years; and a certain number—among Negro males, 377—surviving to the age of 20 years, die in the ages of maturity. Among 1,000 children born therefore, the duration of maturity varies from zero to 40 years, and the average duration per child born, and per child surviving to the age 20 years is a vital characteristic of considerable interest.

In the Negro population the average number of years lived in the ages 20 to 60 years is 18 for males and 19.9 for females. In the white population the corresponding averages are 27.1 years for males and 28.6 years for females. It thus appears that the average duration of maturity among Negro males is shorter than it is among Negro females, and that the average for the Negro population is materially shorter than it is for the white population. The average duration of maturity for Negro males is in fact less than the corresponding average for males in any of the foreign countries listed in Table 16, with exception of India.

If the number of years lived in the ages 20 to 60 years be related to the number, not of children born, but of survivors to the age 20 years, an average duration of maturity is found for Negro males of 29.3 years, for Negro females of 30.7 years, for white males

of 34.2 years, and for white females of 35 years. Among survivors to the age 20 years, the difference between Negroes and whites, as regards average duration of maturity, is less marked than it is as regards the average calculated for all children born. In these figures the effect of the relatively high infant mortality of the Negro population is apparent.

for example, being 13 years; for England, 12.9 years; and for Switzerland, 12.5 years.

CAUSE OF DEATH.

Table 18 classifies deaths in 1913 and in 1910 by principal causes of death, giving for Negroes and whites the number of deaths from each specified cause per 1,000 deaths from all causes, and per 100,000 population. The causes of death are arranged in order according to the number occurring in the Negro population in 1913.

The three principal causes of death in the Negro population—namely, tuberculosis, pneumonia, and organic diseases of the heart—are the principal causes of death also for the white population. Per 1,000 deaths from all causes in 1913, in the Negro population, 366, or more than one-third, and in the white population, 291, are classified under one or other of these three causes.

Relatively to other causes tuberculosis is, however, much more prevalent in the Negro population than in the white. Per 1,000 deaths in the Negro population 176, and in the white population 98, result from some form of tuberculosis. In the white population pneumonia and organic diseases of the heart are nearly of equal importance with tuberculosis as causes of death, the number of deaths from these two causes per 1,000 deaths from all causes being 94 and 99, respectively. In the Negro population these causes are relatively to other causes much less prevalent than tuberculosis, the number per 1,000 deaths from all causes in the Negro population being for pneumonia 100, and for organic diseases of the heart 90.

Violent deaths, excepting suicide, were of the same frequency relatively to other causes, although not relatively to population, among Negroes as among whites, the number of such deaths—which include deaths from all accidental injuries and from homicide—per 1,000 deaths from all causes being 66 in each class of the population.

In general the principal causes of death among Negro males are the principal causes also among Negro females. In 1913 the number of deaths from tuberculosis, for example, per 1,000 deaths from all causes was 177 for males and 175 for females; from pneumonia 107 for males, and 91 for females; and from organic diseases of the heart, 88 for males and 91 for females.

As has been shown in preceding tables, the general death rate from all causes in 1910 was much higher for the Negro element of the population in the registration area than for the white element. In this year per 100,000 population the number of deaths from all causes was 2,546 among Negroes and 1,457 among whites. This higher general rate involves necessarily higher specific mortality rates for the several causes specified in Table 18, and with few exceptions the

³ Probable duration of life.

For Negroes arrived at the age of 60 years, also, the expectation of life (11.7 years for males and 12.8 years for females) is somewhat less than it is for the white population (14 years and 14.9 years), although the expectation for Negro males is not very materially less than the expectation for males at this age in several European countries—the figure for Germany,

number of deaths from each specified cause per 100,000 population was higher in 1910 among Negroes than among whites. The exceptions are cancer—with a rate per 100,000 population of 57 among Negroes and of 77 among whites, cirrhosis of the liver, diphtheria, and croup, measles, diabetes, suicide, erysipelas, and scarlet fever. These are, however, minor causes of death among both Negroes and whites.

Tuberculosis developed a rate per 100,000 population in 1910 of 463 among Negroes, which was more than three times the tuberculosis rate of 148 per 100,000 white population. The rate for pneumonia among Negroes was 298, or more than twice the pneumonia rate of 142 among whites. The rate for organic diseases of the heart was 212 among Negroes and 139 among whites.

Comparison with the white rates of mortality from specific causes provides a rough measure of the possibility of improvement in Negro mortality. In the white population the prevalence of tuberculosis has been diminished in recent years, and there is no reason to believe that this reduction will not continue in the future. The high tuberculosis rate of the Negro population resident in the registration area undoubtedly reflects unfavorable environmental conditions, which

can be largely if not wholly remedied through concerted and intelligent social effort on the part of Negroes and of whites.

It is not improbable that among certain classes in urban communities, and in certain sections of the country, the mortality from specific causes is as high among whites as among Negroes, but no adequate data are available for determining mortality rates for the different social or economic classes of either Negroes or whites. It should be borne in mind, however, that the great mass of the Negro population, including nearly the entire rural Negro population of the South, is outside the area of death registration, and it is highly probable that mortality is much lower in this rural element than it is in the population of the registration area, which is, as has been noted, largely urban and largely a migrant population. In the North, the urban Negro population, at least to the extent that it is a migrant population native of the South, is subjected to conditions similar in some respects to those encountered by the foreign immigrant, and the difficulties of adjustment to these conditions may be reflected in the higher mortalities from such causes as tuberculosis and pneumonia.

¹ Less than 1 per 1,000.

INFANT MORTALITY.

Infant mortality by months of age is shown in Table 14—the partial life table for Negroes and whites—and in the complete life tables for Negro males and females—Tables 31a and 31b.

In the Negro population the number dying in the age interval 0-1 month—that is to say, in the age under 1 month—in the course of a year is very nearly equal to the population living in that age, the population living in the age under 1 month, as figured for the stationary life table population, to one annual death in the same age interval, being 1.07 for Negro males and 1.24 for Negro females. The corresponding number for white males is 1.66 and for white females, 2.14. For this age interval the death rate per month per 1,000 is 73.70 for Negro males and 63.80 for Negro females; the corresponding rates for white males and females being 48.44 and 37.87.

The mortality rate for this first month of age among both Negroes and whites is more than three times the rate for the second month. After the first month of age the decrease in the mortality rate in succeeding months of age is gradual—from 21.35 in the second month to 10.16 in the twelfth month for Negro males; from 18.66 to 8.07 for Negro females; from 13.05 to 4.53 for white males; and from 10.29 to 3.98 for white females. The rapid decline in mortality during the first month of age and the gradual decline in succeeding months is illustrated in Diagram VII, on page 321.

Table 19 gives, for convenience in comparison, the mortality rate under 1 year of age for Negroes and whites, male and female, in 1910 and in 1900, together with the excess of the Negro over the white rate, the excess of the male over the female rate, and the excess of the 1900 over the 1910 rate.

Table 19

SEX AND YEAR.	DEATHS PER 1,000 POPULATION UNDER 1 YEAR OF AGE.		
	Negro.	White.	Excess of Negro over white.
Both sexes:			
1910.....	261.9	129.7	132.2
1900.....	344.5	159.4	185.1
Male:			
1910.....	280.3	143.4	136.9
1900.....	380.0	175.8	204.2
Female:			
1910.....	243.2	115.6	127.6
1900.....	309.7	142.6	167.1
1910.....	37.1	27.8	
1900.....	70.3	33.2	
Excess, 1900 over 1910:			
Both sexes.....	82.6	29.7	
Male.....	99.7	32.4	
Female.....	65.5	27.0	

Although Negro infant mortality in 1910 was greatly in excess of white infant mortality—the excess of the Negro over the white rate being 136.9 for males, and 127.6 for females—the figures for 1910

indicate marked improvement during the decade 1900-1910. In this period infant mortality among Negro males declined from 380 in 1900 to 280.3 in 1910, the decrease in the rate amounting to 99.7, and the rate for Negro females declined from 309.7 in 1900 to 243.2 in 1910, the decrease amounting to 66.5.

URBAN AND RURAL MORTALITY.

The general death rate of the Negro, white, native white, and foreign-born white population, classified as urban and rural, is given in Table 20 for the country as a whole, for the South, and for the North and West. In this table the term "urban" relates to cities in the registration area having a population of 10,000 or more, and the term "rural" to smaller cities and to rural communities. The population classified as rural, therefore, embraces a considerable small-city population in the registration states, which under the definitions of the terms urban and rural in other sections of this report would be classified as urban. Outside of the registration states, cities of less than 10,000 population are not included in the registration area. The urban population of Table 20 is purely urban, although it does not of course embrace the entire Negro or white population living in cities of 10,000 or more, but only the population of such cities which are included in the registration area.

Table 20

Native.....	21,317,297	18,591,614	320,455	233,965	15.0	12.6
Foreign born.....	8,143,346	3,279,537	139,193	57,528	17.1	17.5
The South:						
Negro.....	852,836	143,841	24,951	2,626	29.3	18.3
White.....	2,394,159	545,164	38,054	6,483	15.8	11.9
Native.....	2,058,455	518,672	31,800	5,917	15.4	11.4
Foreign born.....	245,704	25,492	6,854	572	27.9	22.4
The North and West:						
Negro.....	664,263	205,467	16,225	4,187	24.4	20.4
White.....	27,156,484	21,326,987	420,994	285,004	15.5	13.4
Native.....	19,258,842	15,072,942	288,655	228,048	15.0	12.6
Foreign born.....	7,897,642	3,254,045	132,339	56,956	18.8	17.5

¹ In this table "Urban" includes cities of 10,000 or over; "Rural" includes smaller communities and county districts. Rural population and deaths for North Carolina are not included.

For this urban population the general death rate in 1910 was 27.1 among Negroes and 15.6 among whites, and in the rural population, (as defined above), the general death rate was 19.5 for Negroes and 13.3 for whites. The excess of the urban over the rural rate was, therefore, 7.6 for Negroes and 2.3 for whites. In the urban population the Negro mortality exceeded the white by 11.5, and in the rural population by only 6.2. Urbanization appears to be in the case of the Negro population, to a some-

NEGRO POPULATION.

what greater degree than is true of the white population, a condition of high mortality.

In the urban Negro population of the South, the general death rate in 1910 was 29.3, and in the rural Negro population of the South, so far as that population was included in the registration area, the general death rate was 18.3, or less than two-thirds of the urban rate.

Mortality in the foreign-born white population of the southern cities nearly equaled that of the Negroes—the rate being 27.9 for foreign-born whites, as compared with 29.3 for Negroes—and in the rural population the mortality of the foreign-born white exceeded that of the Negroes—the rate being 22.4, as compared with 18.3 for Negroes.

Negro mortality was lower in northern and western, than in southern cities (24.4 as compared with 29.3), and higher in the rural population of the North and

West than in the rural population of the South (20.4 as compared with 18.3). This relatively high mortality in the rural population of the North and West may be in part accounted for by the fact that of the population classified as rural a larger proportion in the North and West than in the South is small-city population, the rural mortality in the North and West tending therefore to approximate the urban mortality.

URBAN MORTALITY IN THE SOUTH AND IN THE NORTH AND WEST.

The specific mortality by sex and age of the aggregate Negro and white population living in selected registration cities of 25,000 or more population in 1910 is shown in Table 21, which tabulates the data separately for southern cities as a group and for northern and western cities.

With reference to these aggregates of urban population, it appears: (1) That mortality among Negroes, male and female, in 1910 exceeded that among whites at each age period shown in southern and in northern and western cities; (2) that mortality among Negro males at all ages, with inconsiderable exceptions, exceeded mortality among Negro females in the South and in the North and West; (3) that among Negroes, male and female, infant mortality in the South exceeded infant mortality in the North and West, although mortality among Negro children 1 to 4 and 5 to 9 was slightly higher in the North and West; and (4) that in the adult Negro population male and female, mortality in the South exceeded mortality in the North and West.

The principal causes of death for the aggregate of Negro population in selected registration cities are shown in Table 22—the cities selected for this analysis being registration cities of 100,000 or more population in 1910, and of 2,500 or more Negro population.

¹ Includes all registration cities of 100,000 or more population and having a Negro population of 2,500 or more in 1910.

On the average in northern and western cities in 1910 tuberculosis was the cause of death in 220 out of 1,000 cases of mortality, that is to say, in 4 or 5 cases of death in the population of all ages 1 death on the average resulted from tuberculosis and 3 or 4 deaths from all other causes combined. Tuberculosis was less predominant in southern cities, where the proportion was 163 deaths from this cause to 1,000 deaths from all causes, or approximately 1 death from tuberculosis to 5 deaths from all other causes combined. Per 100,000 population the death rate from tuberculosis in northern and western cities was 553 and in southern cities, 472.

Other causes of death showing a higher rate in northern and western than in southern cities included bronchopneumonia, bronchitis, whooping cough, measles, and diphtheria. The mortality for pneumonia was higher in southern than in northern and western cities, the number of deaths from this cause per 100,000 population being 256 in the South and 226 in the North and West. Other diseases showing higher rates for the southern cities included diarrhea and enteritis, congenital debility, typhoid, influenza, malaria, and meningitis.

Negro deaths under 1 year in the selected cities are classified in Table 23 by age in days, weeks, or months, for the years 1914 and 1910.

¹ Includes all registration cities of 100,000 or more population having a Negro population of 2,500 or more in 1910.

In 1914 approximately one-fourth of the deaths under 1 year of age in southern and in northern and western cities were infants under 1 week old. Approximately three-fourths of the deaths under 1 year were of infants under 6 months old.

The distribution of infant deaths by the ages shown in Table 23 does not develop any very marked differences between southern and northern and western cities, but the proportion occurring at age under 1 day, in the total of infant deaths returned for 1914, very considerably exceeded the corresponding proportion for 1910. This may be due to stricter enforcement of death registration for infants in the registration area as defined in 1914 than obtained in the area as defined in 1910.

The principal causes of infant mortality in the aggregate population of the larger registration cities are shown in Table 24, deaths from each cause being classified by age in days, weeks, and months.

The most frequent cause of infant mortality shown in Table 24 is diarrhea and enteritis, the proportion of

deaths from this cause being 252 in 1,000 deaths from all causes, or approximately 1 in 4. Other principal causes of infant mortality are premature birth, congenital debility, bronchopneumonia, and pneumonia.

Premature birth is given as the cause of death in 247 out of 397 cases of infant mortality under 1 day, the other chief causes of deaths under 1 day being congenital debility, injuries at birth, and malformations. Premature birth is the most frequent cause of death in the age period "1 day, under 1 week," congenital debility becoming an important cause in this period and the most frequent cause in the period "1 week, under 1 month." Diarrhea and enteritis become the predominant causes of death among infants more than 1 month old, other important causes after the first month being bronchopneumonia, pneumonia, and in the earlier months congenital debility.

² Less than 1 per 1,000.

MONTH OF INCIDENCE OF URBAN MORTALITY.

In Table 25 the 15,955 Negro deaths occurring in 1910 in the selected southern cities of the registration area, and the 11,393 Negro deaths in the selected northern and western cities, are classified according to months of incidence, the distribution per 1,000 by months being shown, and the rate of mortality per 100,000 population in each month, and per day. The monthly mortality rate tends to vary with the number of days in the month. This accidental fluctuation is eliminated in the average per day for each month.

In the southern cities January, February, and June were the months of maximum mortality rate,

and September the month of lowest mortality. In the northern and western cities, March and April were the months of highest, and September and October the months of lowest mortality.

¹ Includes all registration cities of 100,000 or more population and having a Negro population of 2,500 or more in 1910.

MORTALITY BY REGISTRATION STATES.

The Negro and white death rate in the several states of the registration area in 1910 and in 1900 is given in Table 26. None of the Southern states was included in the area in 1900, and only two Southern states, Maryland and North Carolina (municipalities of 1,000 or more population), were included in the area in 1910.

In Maryland, with a Negro population of 232,657, the death rate in 1910 was 23 for Negroes and 14.5 for whites. In Pennsylvania, with a Negro population of 194,646, the death rate was 24 for Negroes, and 15.4 for whites. In each of the other states reporting a considerable Negro population a similar difference in mortality obtained between Negroes and whites.

In New York state, whose Negro population in 1900 exceeded that of any other registration state, the rate of Negro mortality per 1,000 population declined from 27.6 in 1900 to 24.9 in 1910. In New Jersey, also, which reported the second largest Negro population in 1900, the rate declined slightly from 23.9 to 23, while in Indiana, which reported the third largest population in 1900, the rate increased from 21.7 to 23.7.

In a majority of the Northern states, however, the Negro populations are too small to establish rates as generally characteristic of conditions obtaining within the states severally. Variations from state to state, and changes within any state during the decade, may represent in the main differences in age composition of the population groups compared.

Wisconsin.....	2,900	65	22.4	12.0	7.8	8.2	20.3	

¹ Does not include cities of less than 10,000 inhabitants or rural districts in North Carolina.

The rates in this table are figured upon the population as enumerated on April 15, 1910, no estimate being undertaken of the population on July 1, for the several parentage and nativity classes. This

change of population base accounts for the slight difference between the rates shown in Table 27 and those shown in Table 26 for the Negro population.

In 6 of the registration states in 1910—namely, July, Maine, Maryland, Montana, North Carolina, and Vermont—the death rate of the foreign-born white population exceeded that of the Negro population, and in several other states the foreign-born white rate approximated the Negro rate. In 1 state—Maine, which reported a Negro population in 1910 of only 1,363—the death rate for Negroes (13.9) was lower than that for any other class of the population. In 2 states, native whites of native parentage showed the lowest rate; in 6 states, native whites of foreign parentage, and in 11 states and the District of Columbia, native whites of mixed parentage; in Utah the lowest rate, 7.5, being that for native whites of foreign parentage and also for native whites of mixed parentage.

In Table 28 infant mortality in the Negro and white population is shown for registration states reporting 100 or more Negro deaths under 1 year of age in 1910.

Table 28

STATE.	POPULATION UNDER 1 YEAR OF AGE APRIL 15, 1910.		DEATHS UNDER 1 YEAR OF AGE IN CALENDAR YEAR 1910.				
	Negro.	White.	Negro.	White.	Per 1,000 population under 1 year.		Excess Negro over white.
					Negro.	White.	
Dist. Columbia.....	1,458	4,025	581	489	398.5	121.0	277.5
Indiana.....	987	55,107	218	5,777	220.8	104.8	116.0

Massachusetts.....	709	69,934	129	11,235	180.7	160.7	20.0
New Jersey.....	1,729	54,465	504	7,538	291.5	144.3	147.2
New York.....	2,800	186,042	709	26,784	308.3	141.7	166.6
Ohio.....	1,857	96,912	356	11,989	191.7	114.4	77.3
Pennsylvania.....	3,741	185,751	1,063	27,313	284.1	147.0	137.1

In the Negro population of the District of Columbia under 1 year of age in 1910 the number of deaths per 1,000 population was 398.5. The Negro infant mortality rate of the District in this year exceeded that of any of the registration states shown in Table 28. The infant mortality rate for New York state was 308.3 among Negroes and 141.7 among whites; in New Jersey 291.5 among Negroes and 144.3 among whites; in Pennsylvania 284.1 among Negroes and 147 among whites; in Maryland 238 among Negroes and 131.9 among whites; in Indiana 220.8 among Negroes and 104.8 among whites; in Ohio 191.7 among Negroes and 114.4 among whites; and in Massachusetts 180.7 among Negroes and 160.7 among whites.

In Massachusetts the Negro rate most nearly approximates that for the white population, the excess of the Negro over the white rate being only 20 in Massachusetts as compared with 277.5 in the District of Columbia, 166.6 in New York, 147.2 in New Jersey, and large differences in other states.

NEGRO POPULATION.

MORTALITY BY REGISTRATION CITIES.

Table 29 gives the number of Negro and white deaths, and the death rate per 1,000 population for

57 registration cities in 1910 and 1900. The table embraces all registration cities having a Negro population of at least 2,500 in 1910, for which comparable data were available covering the two years.

NEGRO AND WHITE DEATHS, AND DEATH RATES, BY CITIES: 1910 AND 1900.

¹Includes all cities for which data were available for 1900 and for 1910 which reported in 1910 a Negro population of 2,500 or more.

²Includes Allegheny, 1900.

In 15 of the 33 northern and western cities, the Negro death rate was higher and in 18 cities it was lower in 1910 than it was in 1900. In each of the 24 southern cities with exception of two the Negro death rate was lower in 1910 than in 1900.

In each of the 57 cities the Negro death rate exceeded the white in 1910, and also, with two exceptions, in 1900, the difference in the case of most cities being very considerable. In the group of southern cities the Negro death rate in 1910 ranged from 20.3 in Covington, Ky., to 39.3 in Charleston, S. C.; and in the group of northern cities from 15.5 in St. Paul, Minn., to 34.3 in Trenton, N. J.

In 10 southern and in 3 northern cities the Negro death rate in 1910 exceeded 30, the maximum rate for any city being that of 39.3 for Charleston, S. C. In 1900 the Negro rate exceeded 30 in 18 of the southern cities and in 5 of the northern cities, and

DIAGRAM VII.—MONTHLY RATE OF MORTALITY PER 1,000, FOR NEGRO AND WHITE MALES AND FEMALES (1000 q_2), FOR FIRST YEAR OF LIFE, BY AGE INTERVALS OF ONE MONTH.

21857^o—18—21

in 3 southern cities exceeded 40. The lowest rate shown for any southern city in 1900 was that of 22.7 for San Antonio, Tex. The average Negro death rate for the southern cities as a group declined from 33.6 in 1900 to 29.6 in 1910; and for the northern cities from 27.1 to 25.1.

GENERAL TABLES.

The general tables, numbered 30 to 39, present statistics of mortality in detail for areas of death registration.

Reference has been made to Table 30, which gives, by states, the Negro population of the registration area, and of the nonregistration area in 1915, 1910, and 1900; and to the Negro life tables (Tables 31a and 31b).

Table 32 gives, for the registration states and for selected registration cities, the Negro and white population, and deaths, and deaths per 1,000 population, for the two years 1910 and 1900.

Table 33 gives, for Negroes, native whites of native parentage, native whites of foreign parentage, and foreign-born whites, the population, number of deaths, and deaths per 1,000 population in 1910, for registration cities having a total population of 10,000 or more and a Negro population of 2,500 or more.

Table 34 gives data, by age periods, for these same cities.

Table 35 gives, for selected registration cities, the number of Negro deaths in each year 1910-1914, and in 1900, and the number and percentage of deaths under 1 year and under 5 years.

Table 36 classifies Negro deaths in 1910, by month of incidence, for selected cities.

Table 37 classifies Negro deaths in 1913, by sex and cause of death, for registration states and for selected registration cities.

Table 38 classifies Negro and white deaths in 1910, both sexes combined, by cause of death, for the registration states and for selected registration cities.

Table 39 classifies Negro deaths in each year 1910-1914, and 1900, by sex and age, for registration states and selected registration cities.

NEGRO POPULATION.

¹Percentage based on 1910 population.

MORTALITY.

TABLE 31a.—LIFE TABLE FOR NEGRO MALES IN THE ORIGINAL REGISTRATION STATES: 1910.

[Based on the estimated population July 1, 1910 (223,884), and on the reported deaths in 1909 (5,531), in 1910 (6,052), and in 1911 (5,588). The original registration states include Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, and Michigan, and the District of Columbia.]

AGE INTERVAL.	OF 100,000 MALES BORN ALIVE:		RATE OF MORTALITY PER THOUSAND.	COMPLETE EXPECTATION OF LIFE.	STATIONARY MALE POPULATION, UNAFFECTED BY EMIGRATION AND IMMIGRATION, WHICH, ASSUMING THE MORTALITY RATES IN COLUMN 4, WOULD RESULT IF 100,000 MALES WERE BORN ALIVE UNFORMALLY THROUGHOUT EACH YEAR.			
	Number alive at beginning of age interval.	Number dying in age interval.	Number dying in age interval among 1,000 alive at beginning of age interval.	Average length in life remaining to each one alive at beginning of age interval.	Population living in age interval.	Population living in age interval to one annual death in same age interval.	Total population living in current and all higher age intervals.	Average death rate per thousand of the total population living in current and all higher age intervals.

NEGRO POPULATION.

TABLE 31a.—LIFE TABLE FOR NEGRO MALES IN THE ORIGINAL REGISTRATION STATES: 1910.

(Based on the estimated population July 1, 1910 (23,284), and on the reported deaths in 1909 (5,331), in 1910 (6,032), and in 1911 (5,888). The original registration states include Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, and Michigan, and the District of Columbia.)

AGE INTERVAL.	OF 100,000 MALES BORN ALIVE:		RATE OF MORTALITY PER THOUSAND.	COMPLETE EXPECTATION OF LIFE.	STATIONARY MALE POPULATION, UNAFFECTED BY EMIGRATION AND IMMIGRATION, WHICH, ASSUMING THE MORTALITY RATES IN COLUMN 4, WOULD RESULT IF 100,000 MALES WERE BORN ALIVE UNIFORMLY THROUGHOUT EACH YEAR.			
	Period of lifetime between two exact ages.	Number alive at beginning of age interval.			Number dying in age interval.	Number dying in age interval among 1,000 alive at beginning of age interval.	Average length of life remaining to each one alive at beginning of age interval.	Population living in age interval.

NEGRO POPULATION.

TABLE 31d.—LIFE TABLE FOR NEGRO FEMALES IN THE ORIGINAL REGISTRATION STATES: 1910.

(Based on the estimated population July 1, 1910 (239,814), and on the reported deaths in 1909 (5,025), in 1910 (5,481), and in 1911 (5,347). The original registration states include Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, and Michigan, and the District of Columbia.)

AGE INTERVAL.	OF 100,000 FEMALES BORN ALIVE:		RATE OF MORTALITY PER THOUSAND.	COMPLETE EXPECTATION OF LIFE.	STATIONARY FEMALE POPULATION, UNAFFECTED BY EMIGRATION AND IMMIGRATION, WHICH, ASSUMING THE MORTALITY RATES IN COLUMN 4, WOULD RESULT IF 100,000 FEMALES WERE BORN ALIVE UNIFORMLY THROUGHOUT EACH YEAR.			
	Number alive at beginning of age interval.	Number dying in age interval.			Number dying in age interval among 1,000 alive at beginning of age interval.	Average length of life remaining to each one alive at beginning of age interval.	Population living in age interval.	Population living in age interval to one annual death in same age interval.

CHAPTER XV.—SCHOOL ATTENDANCE.¹

CHARACTER OF THE DATA.

The statistics of Negro school attendance in this chapter are derived from the Thirteenth and earlier census reports.

As regards 1910, the data are based upon the answers to an inquiry addressed by the census enumerators to each person enumerated, asking whether that person had attended school at any time during the period between September 1, 1909, and April 15, 1910, the date of enumeration. If the persons enumerated had, at any time during that period, attended any kind of a school, the question was to be answered in the affirmative. The inquiry relating to school attendance was a general inquiry, to be answered by persons of both sexes, and all ages from infancy upward, and the term "school" covered public and private day schools and night schools, kindergartens, colleges, universities, and professional schools. Since, however, the period covered by the 1910 census returns does not embrace a full year of 12 months, nor even a full school year, but only a portion of the school year of 1909-1910, persons who had in 1909 attended summer schools only were not returned as attending school at all, nor were persons who graduated from school in June, 1909, or who entered school subsequently to April 15, 1910. Comparatively few children, however, enter school during the closing months of the school year, and the census returns may be accepted as practically covering school attendance during the school year 1909-1910.

In interpreting these statistics, comparisons between different sections of the country and different classes of population are both interesting and essential. They are, however, apt to be misleading unless varying conditions are kept in mind.

Among these may be mentioned such disparities as the following: The varying length of the term covered by the school year; the varying grade of the teachers employed; the varying character of the curriculum. A school year of 40 weeks is more productive of results than one of 10 or 12 weeks; a graduate of a high-grade normal school is a better teacher than a graduate of a local grammar or high school, who has never been beyond the local surroundings; a system of graded schools is of far greater educational value

to a community than the ordinary ungraded school of remote country districts. Into the consideration of these conditions this report of course can not enter, except occasionally, and to a limited extent, but they are referred to as indicating that records of school attendance do not enable one to determine precisely the relative educational status of any given community or class of population.

Generally, where comparisons with other classes seem significant, figures for the white population as a whole are given, rather than for any class of whites, such as the native whites of native or mixed parentage, or the foreign-born whites. In the case of children 6 to 14 years of age, however, subclassifications of whites are introduced.

POPULATION OF ALL AGES IN SCHOOL: 1910.

A summary of the school attendance returns for the total population classified by race, nativity, and parentage, is given in Table 1.

RACIAL CLASS.	POPULATION: 1910.		PERCENTAGE DISTRIBUTION.		
	Total.	In school.		Total population.	Population in school.
		Number.	Per cent.		
All classes.....	91,972,266	18,009,891	19.6	100.0	100.0
Negro.....	9,827,763	1,670,650	17.0	10.7	9.3
White.....	81,731,957	16,279,292	19.9	88.9	90.4
Native white.....	68,386,412	15,827,786	22.9	74.4	88.8

Japanese.....	72,157	2,912	3.5	0.1	(¹)
All other.....	3,175	92	2.9	0.1	(¹)

¹ Less than one-tenth of 1 per cent.

In a total population of 91,972,266, there were 18,009,891 persons, constituting 19.6 per cent, or nearly one-fifth of the total population, who had attended school at some time during the period from September 1, 1909, to April 15, 1910. Comparing the different classes of population it will be noted that, with the exception of the foreign-born whites, the Chinese, and the Japanese, the proportion in school, for the several classes, does not vary greatly from the average for all classes combined; of the Negroes 17 per cent, of the native white 22.9 per cent, and of the Indians 20.1 per cent, reported school attendance, the corresponding percentages for the foreign-born

¹ For data relating to school attendance of the black and mulatto population, see section on "School attendance of black and mulatto children" in Chapter XI, p. 215, and Table 16 of that chapter, p. 215.

whites being 4.9, and for the Chinese and Japanese 5.4 and 3.5, respectively. In considering these comparisons it is to be remembered that the figures given in Table 1 include, for the population of each class, infants and adults as well as children of school age; and for the population in school, every person, young or old, who was reported as attending school. In the following tables, however, the figures both for population and for school attendance are in general restricted to the school-age period or periods.

POPULATION OF SCHOOL AGE IN SCHOOL: 1910.

In presenting a classification by age periods the difficulty is encountered at the outset that while there is a general consensus, there is no absolute agreement as to the period to be included in the term "school age." The classification in the census of 1900 was based on a school-age period of 5 to 20 years, inclusive, while the census of 1910 defined it as including the years 6 to 20. The reports of the Bureau of Education adopt the period 5 to 18 years of age, while the statutes of the individual states designate various age limits for the period of free or compulsory attendance. Table 2 shows the number of persons attending school 6 to 20 years of age—that is to say, the number of school age according to the 1910 census definition—and also the number under 6, and 21 years and over, for both Negroes and whites.

Table 2

AGE.	POPULATION IN SCHOOL: 1910.			
	Number.		Percentage distribution.	
	Negro.	White.	Negro.	White.

Age unknown.....	832	5,102	(¹)	(¹)

¹ Less than one-tenth of 1 per cent.

Classified by age, of the total number of Negroes reported in 1910 as having attended school, 1,619,699, or 97 per cent, were of school age, i. e., 6 to 20 years of age; 28,560, or 1.7 per cent, were under 6 years of age; and 22,391, or 1.3 per cent, were 21 years and over. With regard to those under 6, it is to be noted that 25,060 were reported as 5 years of age, leaving 3,500 for the ages under 5.

Nearly one-half (47.4 per cent) of the entire number attending school are in the 10 to 14 year period. If these proportions be compared with the corresponding proportions for whites, it appears that the proportion in the 10 to 14 year period is somewhat larger for Negroes than for whites, although in general the

differences in the age distribution of the two classes are not marked.

INCREASE IN SCHOOL ATTENDANCE BY SEX AND AGE: 1900-1910.

Satisfactory comparisons between the statistics of school attendance for the two censuses, 1910 and 1900, are rendered difficult by the change from the 5 to 20 to the 6 to 20 age period as the basis of tabulation, and by a change in the questions presented by the enumerators. In 1900 the question covered the number of months spent in school, while in 1910 the only item recorded was actual presence of the individual in school at some time during the school period. To meet the first difficulty a special tabulation of persons 5 years of age was made in the census of 1910, as a result of which it is possible to show, in Table 3, comparative figures covering the age period 5 to 20. The table shows the number in school and the number not in school.

Among those classified in these tables as "not in school" are, of course, included many who have in past years attended school. A child 14 years of age not in school in 1909-1910, may nevertheless have attended school previously during six or seven years; a young man or woman 20 years of age not in school may have graduated with honor from a high school or college. Making all due allowance, however, for such cases, it remains true that, especially in the earlier age periods, the number "not in school" is significant in relation to one phase of the educational problem of the community.

During the decade 1900-1910 the number of Negroes 5 to 20 years of age attending school increased from 1,083,516 to 1,644,759, the increase amounting to 561,243, or more than 50 per cent. Only 31 per cent of the Negro population of that age were in school in 1900, the proportion in 1910 being 44.7 per cent. Although the population was increasing, the number not in school decreased from 2,415,671 to 2,033,101, the decrease amounting to 382,570, and the percentage not in school falling from 69 to 55.3. In the same decade and covering the same age period, for whites the percentage in school rose from 53.6 to 61.3, and the percentage not in school decreased from 46.4 to 38.7. Thus, for whites the percentage in school increased and the percentage not in school decreased by 7.7; while for Negroes the corresponding change in the percentages amounted to 13.7.

Turning to the component age periods, the number of Negroes in school, 5 to 9 years of age, increased during the decade 229,230; the number 10 to 14 years of age, 204,435; and the number 15 to 20 years of age, 127,578. The increase in the percentage attending school for these several age periods amounted to 17.5, 14.8, and 9, respectively, while the corresponding increases in the percentages for the whites were 12.8, 7.1, and 5.4. It is noteworthy that the increase in the percentage in school for the Negroes was, in each case, greater than that for the whites, indicating a more or

less rapid approximation among Negroes to the condition obtaining among whites in regard to school attendance. Especially marked is the increase of school attendance among Negro children 5 to 9 years of age. The number of such children in school in-

creased from 284,784 in 1900 to 514,014 in 1910. In 1900, 76.3 per cent, or more than three-fourths of the children in this age period, were not in school, while in 1910 the proportion not in school had fallen to 58.8 per cent.

NEGRO AND WHITE POPULATION 5 TO 20 YEARS OF AGE IN SCHOOL AND NOT IN SCHOOL, BY SEX AND AGE PERIODS: 1910 AND 1900.

Decrease, 1900-1910.....	55,976	29,366	26,610	9.0	8.8	9.1	5.4	5.9	5.0

Noting the sex distribution of the population in school, it appears that among the Negroes in each age period the females outranked the males as regards the number and percentage attending school at each census, and that the two sexes have made approximately equal advances during the decade, while among the whites the differences in the percentages by sex at each census are inconsiderable.

Table 4 shows the increase per cent for Negroes attending school during the decade 1900-1910, by sex and age periods, and the corresponding increase for the total Negro population of the same sex and age groups.

AGE PERIOD.	PERCENTAGE INCREASE OF NEGRO POPULATION: 1900-1910.					
	Both sexes.		Male.		Female.	
	Total.	In school.	Total.	In school.	Total.	In school.
5 to 20 years.....	5.1	51.8	4.4	53.4	5.8	50.4
5 to 9 years.....	3.6	80.5	3.1	78.8	4.2	82.1
10 to 14 years.....	5.8	34.8	5.4	36.6	6.2	33.2
15 to 20 years.....	5.9	60.4	4.8	66.3	6.9	56.3

While the Negro population of the United States as a whole increased by 11.2 per cent during the decade

1900-1910, the increases for the school-age periods were at much lower rates, varying, as shown in Table 4, from 3.6 to 5.9 per cent. The fact that the percentages for those ages are below the average for the entire population is noted and discussed in the chapter on age distribution. It is necessary here to call attention only to the notable difference between them and the percentage increases for the population attending school. The percentage increase of the population 5 to 20 years of age in school was ten times the increase of the total population of that age, the percentages being 51.8 and 5.1, respectively. In the component age periods the corresponding increases are 80.5 and 3.6 per cent for children 5 to 9 years of age, 34.8 and 5.8 per cent for children 10 to 14, and 60.4 and 5.9 per cent for those 15 to 20 years of age.

Comparing the sexes, it may be noted that while for each of the age periods under review the percentage increase in the total population is higher for females than for males, in the school attendance population the percentage increase is higher for males than for females, except in the age period 5 to 9 years.

Some of this apparent improvement may be attributed to a change in the form of the schedule inquiry, which, it is believed, was more favorable to securing

NEGRO POPULATION.

correct answers in 1910 than in 1900. Making, however, all due allowance for this change, the actual improvement is very marked.

In Table 5 the increase or decrease of the Negro population 5 to 20 years of age, in school and not in school, is given in comparison with corresponding data for the white population.

Table 5

5 to 9 years of age.....	8,475,173	7,638,326	836,847	11.0		
In school.....	5,495,043	3,971,175	1,523,868	38.4		
Not in school.....	2,980,130	3,667,151			687,021	18.7
10 to 14 years of age.....	7,918,408	6,959,238	959,170	13.8		
In school.....	7,212,607	5,846,411	1,366,196	23.4		
Not in school.....	705,801	1,112,827			407,026	36.6
15 to 20 years of age.....	9,598,712	7,844,383	1,754,329	22.4		
In school.....	3,237,762	2,222,038	1,015,754	45.7		
Not in school.....	6,360,950	5,622,375	738,575	13.1		

It will be noted that while the Negro population 5 to 9 years of age increased 43,795, or 3.6 per cent, in the decade 1900-1910, the number of that age in school increased 229,230, or 80.5 per cent, and the number not in school decreased 185,435, or 20.2 per cent. For each age period, although the percentage increase for the white population exceeded that for the Negro population, the percentage increase for the white population in school, being, in the age period 5 to 9 years, 80.5 for Negroes, as compared with 38.4 for whites; in the age period 10 to 14 years, 34.8 for Negroes, as compared with 23.4 for whites; and in the age period 15 to 20 years, 60.4 for Negroes, as compared with 45.7 for whites.

INCREASE REPRESENTING IMPROVEMENT.

A significant indication of the nature of the increase in school attendance in the Negro population is found in Table 6, showing the proportion of that increase which may be regarded as the natural result of the

growth in population, and the proportion due to improved conditions and greater interest in education.

Table 6

ITEM.	NEGRO POPULATION.			
	5 to 20 years of age.	5 to 9 years of age.	10 to 14 years of age.	15 to 20 years of age.
Total, 1910.....	3,677,860	1,246,553	1,155,269	1,276,041
Percentage in school, 1900.....	31.0	23.7	53.8	17.5
Corresponding proportion of 1910 population.....	1,140,273	295,433	621,533	223,307
Number in school: 1910.....	1,644,759	514,014	791,995	338,750
1900.....	1,083,516	284,784	587,560	211,172
Increase of number in school, 1900-1910.....	561,243	229,230	204,435	127,578
Due to growth of population.....	56,757	10,649	33,973	12,135
Due to increased proportion in school.....	504,486	218,581	170,462	115,443

The total number of children 5 to 20 years of age in school was 1,083,516, or 31 per cent of the Negro population of that age in 1900, and 1,644,759, or 44.7 per cent in 1910. If the same general conditions had obtained in 1910 as in 1900 and the same percentage of the population—31 per cent—had been in school, the total number in school would have been 1,140,273, an increase over 1900 of 56,757. In fact the total increase during the decade was 561,243. If the increase of 56,757 be deducted as representing growth of population, there remains 504,486, which may be regarded as the increase resulting from improved conditions and greater interest in education.

Applying the same method to the component age periods, it appears that in the age period 5 to 9 years, only 10,649, or less than 5 per cent of the total increase for that age period may be accounted for by growth in population, the remaining 218,581, or 95 per cent of the total increase, representing improvement in conditions; in the 10 to 14 year period the increase representing growth of population is 33,973, about 16 per cent of the total increase, and that representing improvement, 170,462, or 84 per cent; in the 15 to 20 year period, the figures are 12,135, representing growth of population, and 115,443, representing the general advance in school attendance.

AVERAGE INCREASE IN AMOUNT OF SCHOOLING: 1900-1910.

As has been noted, the census returns include no statement of the number of months or of years of schooling, but only a return in the case of the 1910 census of the fact of attendance or nonattendance at some time during the period September 1, 1909, to April 15, 1910. It is, however, possible to estimate approximately from these returns the number of years in which on an average a child who attains the age of 5 or 6 attends school during the school age period. In the case of the Negro population, for example, the total number 6 to 20 years of age, in 1910 was 3,422,157; of this total, 1,619,699, or 47.3 per cent, were in school, which on the assumption that

each child in school attended a full year is equivalent to an average attendance per child during 1909-10, of 47.3 per cent of one year. If this be regarded as representing a permanent condition, children attaining the age of 6 years would, during the school age period of 15 years, attend school on the average approximately 7 years. The corresponding average for Negro males is 6.8 years and for Negro females 7.4 years; for whites, 9.7 years, which is the average also for white males and for white females; for native white males 10 years, and for native white females 9.9 years. By a similar calculation it will be found that Negro children, during the period of 9 years, extending from the age of 6 to the age of 14, inclusive, attend school on the average 5.4 years; native white children of native parentage 7.5 years, and native white children of foreign or mixed parentage 7.9 years. Comparing 1910 with 1900, with reference to school attendance for children during the age period of 16 years, i. e., from the age 5 to and including the age 20, the 1900 returns indicate for Negro children an average attendance at school of 5 years during the age period 5 to 20 years; the 1910 returns for this age period indicate an average attendance of 7.1 years.

It would appear from these figures that Negro children 5 to 20 years of age were receiving on the average two years more of schooling in 1910 than they were receiving in 1900. For the Negro males the advance was from 4.7 to 6.9 years; and for Negro females, from 5.2 to 7.4 years; for white children, from 8.6 to 9.8 years. While these averages may be somewhat affected by changes in the age composition of the population 5 to 20 years of age for the several

classes during the decade 1900-1910, they indicate, nevertheless, with a fair degree of accuracy the actual increase in the average amount of schooling received by children during the school-age period. Statistics of school attendance are not available by single years of age for 1900, a correction of the averages by single years of age, therefore, can not be made, but that the changes in age composition are immaterial may be inferred from the fact that a calculation based upon the age periods 5 to 9, 10 to 14, and 15 to 20, for Negroes, gives practically the same results as are obtained by the above calculation based upon the total population 5 to 20 years of age.

SCHOOL ATTENDANCE BY SINGLE YEARS OF AGE: 1910.

Statistics of school attendance by single years, are shown in Table 7. In this table evidence will be found of concentration of population upon even as compared with odd years of age. When the exact age of a child is unknown it appears that it is more commonly reported as 6, 8, 10, or 12 years of age, rather than as 7, 9, 11, or 13. The concentration upon the age of 10 is very marked. The result is a fluctuation in the enumerated population totals from year to year, which certainly does not in fact characterize the actual age distribution of the population. Since, however, the error in the age returns affects the total population and not simply those in school, the percentage in school does not reflect the fluctuations in the population as returned. This percentage indicates, therefore, fairly correctly, the proportion in school for the different years.

NEGRO POPULATION.

DIAGRAM I.—PERCENTAGE ATTENDING SCHOOL BY SINGLE YEARS OF AGE, FOR NEGROES, NATIVE WHITES, AND FOREIGN-BORN WHITES: 1910.

As given in Table 7, the largest numbers reported as attending school were those for 12 years of age, while the highest percentages were those for 11 years. The ages 10, 11, and 12 years are the years of maximum school attendance. The drop in the percentage for those 14 years of age for both Negroes and whites reflects the fact that attendance at school is seldom compulsory for those 14 years of age or older. In each year of age, the whites exceed the Negroes in

percentage of attendance, the difference being greatest in the youngest years of the school period.

The data relating to school attendance by single years of age are presented graphically in Diagram I for Negroes, native whites, and foreign-born whites, and in Diagram II for Negroes and whites. The tendency to drop out of school on attaining the age 14 is very apparent in these diagrams.

DIAGRAM II.—PERCENTAGE IN SCHOOL AND NOT IN SCHOOL BY SINGLE YEARS OF AGE, FOR THE NEGRO AND WHITE POPULATION: 1910.

SECTIONS AND DIVISIONS.

Table 8 shows the number and the percentage in school for Negroes and whites, by geographic sections and divisions.

Pacific.....	5,836	3,556	60.9	659,993	66.2	0.2	4.2	

Approximately nine-tenths of the Negroes reported in 1910 as attending school were in the South, the percentage in that section being 90.6, as against 9.1 per cent in the North and 0.4 per cent in the West. Comparing these figures with those for the whites, it will be noted that the great majority of whites attending school are in the North, the proportion being 65.3 per cent, as against 9.1 for the Negro school population, and the proportion in the South being 27.4 per cent for the whites, as against 90.6 per cent for the Negroes.

Of the total Negro population 6 to 20 years of age in the South, 46.4 per cent had attended school during the school year 1909-1910; in the North, 59.2 per cent; and in the West, 60.8 per cent. For the whites the corresponding percentages were 62.1 in the South, 65.3 in the North, and 66.5 in the West. It thus appears that in the North and West the proportion of Negroes attending school is nearly on a par with that of the whites; while in the South the proportion for Negroes is markedly lower than for whites. The probable explanation is that in the North and West the Negro communities are closely identified with the white communities, have the same facilities for school attendance, and share in the general influences of the community life; while in the South they are to a greater

NEGRO POPULATION.

degree isolated in rural and agricultural communities in which the school facilities are relatively inadequate. For both classes the proportion in school is lower in the South than it is in the North, although the difference is inconsiderable in the case of the whites.

The conditions prevailing in the three sections are in general reflected in the several geographic divisions of the North, the South, and the West. In New England where the population is largely centralized and located in urban communities, school attendance of

Negroes and of whites is represented by nearly identical proportions, 65.6 and 66.1 per cent, respectively. In the three southern divisions the percentages for both races are below the corresponding percentages for northern and western divisions—being markedly lower in the case of Negroes.

Table 9 shows the Negro population in school and not in school, by age periods, sections, and divisions, in 1910 and in 1900, the comparison being based upon the population 5 to 20 years of age.

In the South the number of children 5 to 20 years of age in school increased from 955,365 in 1900 to 1,488,871 in 1910, an increase of 533,506. This aggregate increase represents an increase of 216,872 in the number of children 5 to 9 years of age in school; an increase of 196,554 for the age group 10 to 14; and of 120,080 for the age group 15 to 20. Although population increased in each age group, the number not in school in each age group decreased.

Table 10 presents, by sections and divisions, the percentage in school for Negroes and for whites, in 1910 and in 1900, by age periods, and the increase in this percentage.

The percentage of school attendance for Negroes 5 to 20 years of age in the South as a whole increased from 29.6 in 1900 to 42.7 in 1910, a gain of 14.1 in the percentage, the corresponding gain for the whites being 12.4. The percentage in school for Negro children 5 to 9 years of age increased from 21.7 to 39.5; for those 10 to 14 from 51.6 to 67, and for those 15 to 20 from 17.3 to 26.6. The gains in the percentages for these age periods were 17.8, 15.4, and 9.3, respectively, for Negroes, and 18.5, 11.1, and 8.1, respectively, for whites. In the several sections and divisions the Negroes show relatively larger gains than the whites, indicating a general approximation to the status of

the white population. In each southern division in 1910 approximately two-thirds of the Negro population 10 to 14 years of age were in school; and in three northern divisions more than nine-tenths. For the total 5 to 20 years of age, and in the age groups 5 to 9 and 10 to 14, the highest Negro records are those

for the New England division, in which 94.3 per cent of the children 10 to 14 years of age were in school in 1910. The highest white record is for the same division, the percentage of 94.1 per cent being practically identical with that for Negroes in this age group.

A comparison of the number in school with the number not in school is made for Negroes 10 to 14 years of age in 1910 for sections and Southern divisions in Diagram III.

In general, it is evident from the comparisons between the two censuses that school attendance among

the Negroes advanced rapidly during the decade in all sections of the country, and especially in the South.

Tables 11, 12, and 13 show statistics of school attendance, by single years of age, by sections and southern divisions.

DIAGRAM III.—NEGROES 10 TO 14 YEARS OF AGE IN SCHOOL AND NOT IN SCHOOL, FOR SOUTHERN DIVISIONS, THE NORTH, AND THE WEST.

NEGRO POPULATION.

In number and percentage of Negroes in school in different sections of the country by single years of age, the South shows for each single year, as for each age period, the largest numbers and the smallest percentages. The record for the three southern divisions does not vary greatly from the average for the South as a whole. Throughout the South, for the ages 8 to

15 years, inclusive, each year shows a majority of the Negro population of that age in attendance at school.

Table 12 carries out the comparison as regards school attendance, by single years of age, between Negroes and whites in the different sections and southern divisions, and Table 13 gives the converse, showing the percentage not in school.

AGE GROUP 6 TO 14 YEARS.

Perhaps the best index of school attendance of a community is furnished by data for the 6 to 14 year age period. This is the period when there is the least demand or opportunity for wage-earning employment, and the least hindrance to school attendance. With exception of the age 14 years, this period is included, practically, in the period covered by the state laws for compulsory school attendance, where such exist; and as a result, wherever there are any adequate school facilities the presumption is that each child from 6 to 14 years of age is in school unless prevented by sickness or some other abnormal condition. Table 14 presents data for this age group, by racial classes.

Of Negro children 6 to 14 years of age 865,167, or 40.3 per cent, had not attended school at any time during the school year 1909-10. Of this number 841,997 were in the South. The percentage of white children of this age not in school was in the country as a whole 15.3; in the South, 24.4; and in the North, 11.1. Even for the foreign-born white 6 to 14 years of age, the percentage not in school in the country as a whole was only 17.7, although it was much higher in the South, 45.7, where the number of the foreign born is relatively insignificant. In the North the percentage not in school for Negro children 6 to 14 was 15.9, being only slightly larger than the corresponding percentage for white children in the country as a whole. By divisions the highest percentage for Negroes not in school is that of 45.7 in the West South Central division, which happens to be exactly the same

as the percentage for foreign-born whites in the South as a whole, but is markedly above that for foreign-born whites in the South Atlantic and East South Central divisions. In the North and West Negroes rank close with other racial classes in school attendance.

NEGRO POPULATION.

DIAGRAM IV.—PERCENTAGE IN SCHOOL AND NOT IN SCHOOL OF THE NEGRO AND WHITE POPULATION 10 TO 14 YEARS OF AGE, BY SECTIONS AND SOUTHERN STATES: 1910.

SCHOOL ATTENDANCE BY STATES.

Statistics of school attendance for states are given in Tables 22 to 27 (pp. 391-398), Table 27 covering, for the age 10 to 14, the years 1910, 1900, and 1890. Percentages in school, by sex and age, are given for Southern states in Table 15, which shows also the number of males per 1,000 females in school.

As has been already noted the number of Negro females in school is in excess, sometimes largely in excess, of the number of Negro males. This is true of the country as a whole and of each Southern state for each age period, with the exception of the age periods 10 to 14 and 15 to 20 in the state of Delaware. Likewise the percentage in school for females is higher than the percentage for males, although this higher percentage in school for females does not entirely account for the excess of females in the school

population, as becomes evident when the number of each sex not in school is noted. Thus in the 6 to 9 year age period in the country as a whole, the number of girls in school exceeds the number of boys by 14,630, but the number of boys not in school exceeds the number of girls not in school by only 8,712, indicating that a portion of the excess of females in the school population is attributable to the excess of females in the total population of school age. In the 10 to 14 year period the relative excess of females is greater than in the 6 to 9 year period, and in the 15 to 20 year period the number of females in school exceeds the number of males by 52,420, the ratio of males to females in the school population of this age being only 732 to 1,000. Among those not in school of this age, also, the females exceed the males by 22,743. The marked excess of females in this age period is noted in the chapter on age distribution.

SCHOOL ATTENDANCE.

Texas.....	46.6	48.9	77.0	81.3	26.7	32.4	946	947	747	

An excess of females over males in the school population is found in nearly all of the states. The only exceptions are in some of the Northern states and in the state of Delaware, representing in each case a relatively small Negro population.

Among the Southern states West Virginia takes the lead in Negro school attendance for children 6 to 9 years of age, and Oklahoma, for those 10 to 14 years, while Louisiana reports the lowest percentage in each period and for each sex.

Diagram IV represents the percentage in school and not in school of the Negro and white population of sections, and southern divisions and states, for the age 10 to 14 years, in 1910.

URBAN AND RURAL COMMUNITIES.

In Table 28 (p. 399) the statistics of school attendance are given for the population classified as urban and rural. These statistics are summarized by sections in Table 16. It will be recalled that under the census definition the term "urban" covers all cities and incorporated towns with 2,500 or more inhabitants, all other areas, including incorporated places with less than 2,500 inhabitants, all unincorporated towns and villages, and the open country, whether closely or sparsely settled, being regarded as rural.

URBAN AND RURAL SCHOOL ATTENDANCE OF NEGROES AND WHITES, BY SECTIONS: 1910.

The North.....	8,665,012	5,410,609	62.4	80.4	80.5	6,959,684	4,797,740	68.9	51.8	53.9						
The West.....	764,816	502,765	65.7	7.1	7.5	843,120	633,730	67.2	7.0	7.1						

The total Negro population 6 to 20 years of age, in 1910, was 3,422,157. Of this number, 2,699,493, or 78.9 per cent, were in rural communities and 722,664, or 21.1 per cent, in urban communities. Of the rural population, 1,245,808, or 46.1 per cent, and of the urban population, 373,891, or 51.7 per cent, were in school. The corresponding figures for the whites show that of the total population of school age 55.5 per cent were in rural and 44.5 per cent in urban communities; and that 66.3 per cent of the rural and 62.3 per cent of the urban population were in school.

Taking the country as a whole, therefore, in school attendance the rural Negroes rank lower and the rural whites rank higher, than those in the urban class. Comparing the sections, the percentage in school in both urban and rural communities, for both Negroes and whites, in the South is below the corresponding percentage in the North and West.

In both urban and rural communities the percentages for Negroes correspond more closely to those for whites in the North and West than they do in the South. It is noticeable also that the difference

NEGRO POPULATION.

between the percentages for Negroes and whites in the South is far greater in the rural than in the urban districts. Thus the percentage in school in the rural South is 45.8 for Negroes and 62.8 for whites, the difference in the percentages being 17; while in the urban districts the Negro percentage is 49.2 and the white percentage 59.4, the difference being 10.2. In the North where the facilities for the races are more nearly equal, the attendance for Negroes in urban communities is 58.9 per cent and for whites 62.4, the difference being 3.5; and the attendance for Negroes in rural communities is 60 per cent and for whites 68.9, the difference being 8.9.

Table 17 presents data for Negro school attendance in urban and rural communities of the South, North, and West, by age periods.

In the country as a whole, and in each section, the percentage attending school in the Negro population is higher for the urban than for the rural communities, in the first two age periods—6 to 9 and 10 to 14 years—and lower in the third—15 to 20 years. For the age period 6 to 9 years the urban school attendance represents a majority of the population of that age in every section of the country, while in the rural districts in every section of the country a majority of the children of this age are still not in school. In the age group 10 to 14 years a majority are in school in both urban and rural districts in each section, the per-

centage in the North rising to 91 for urban and to 86.3 for rural attendance. In the age group 15 to 20 years a great majority in each section are not in school. The explanation of the higher percentage of attendance in rural communities for this last age period is probably to be found in the tendency in the rural districts to commence school later and to continue later than in the urban districts. The higher percentages for urban over rural attendance for children 6 to 9 is probably due in some measure to the difficulty, especially in the remoter rural sections, of getting the younger children to school.

SCHOOL ATTENDANCE IN CITIES.

The statistics for Negro and white school attendance for cities are given in Tables 29 and 30 (pp. 400 and 401).

¹ Includes cities of 25,000 or more inhabitants having a Negro population 6 to 14 years of age of at least 1,000.

The preceding table (18) gives the total number of Negro children 6 to 14 years of age, the number in school and not in school, and the percentage in school, for each city of 25,000 or more inhabitants which reports 1,000 or more Negro children of the specified age, and Table 20 gives, for these same cities, the percentage of school attendance for both Negroes and whites. In the first table cities are arranged in order of Negro population of specified age, and in the second in order of percentage of attendance.

Of the 50 cities included in the list all but 12 are in the Southern states. In Negro population 6 to 14 years of age, New Orleans leads and Washington, D. C., comes next, while Philadelphia, New York, and St. Louis stand high in the list. In numbers in school, Washington stands first, New Orleans comes next, then Baltimore, Philadelphia, and New York. The 10 cities having the largest Negro population 6 to 14 years of age, in school and not in school, arranged in the order of the number, are listed in Table 19.

Order.	Table 19 CITY.	Number in school.	Order.	CITY.	Number not in school.
1	Washington, D. C.	10,807	1	New Orleans, La.	4,544
2	New Orleans, La.	9,446	2	Baltimore, Md.	2,756
3	Baltimore, Md.	8,509	3	Richmond, Va.	2,413
4	Philadelphia, Pa.	8,051	4	Atlanta, Ga.	2,326
5	New York, N. Y.	7,783	5	Birmingham, Ala.	2,175
6	Birmingham, Ala.	5,807	6	Memphis, Tenn.	2,123
7	Atlanta, Ga.	5,685	7	Washington, D. C.	2,103
8	Richmond, Va.	4,514	8	Charleston, S. C.	1,859
9	Memphis, Tenn.	4,317	9	Savannah, Ga.	1,655
10	Nashville, Tenn.	4,098	10	Philadelphia, Pa.	1,553

More significant of the situation, however, are the percentages given in Table 20 for Negroes and whites 6 to 14 years of age.

In northern cities generally the percentage of Negroes attending school is high, and the excess of the percentage for whites over that for Negroes is small. In the case of three cities the percentage for Negroes exceeds that for whites—namely, Chicago, Tampa, and Houston. The greatest excess of the percentage for whites over that for Negroes is 18.8, that shown for Mobile, while in the same state Montgomery shows an excess of only 1.7 and Birmingham of only 2.5. The great divergencies shown by the several cities make it evident that a variety of factors

enter into the question of school attendance, and that these factors can not be summed up in any general statement covering the cities as a group, since the statistics for each city represent conditions prevailing locally in that community and, perhaps, nowhere else.

Table 20

In Table 21 the statistics of Negro and white school attendance in the aggregate population of cities of 25,000 or more inhabitants, for the entire age period 6 to 20 years, and for the included periods, are presented by sections and divisions. The detail shown in this table for the aggregate population living in cities of 25,000 or more inhabitants is shown, for the individual cities, in Table 30 (p. 401).

Comparison of the percentages in Table 21 with those in Table 16, preceding, shows that the ratios of school attendance for this class of cities do not differ materially from those for the urban population as a whole. The percentage of attendance in the North is higher than that in the South for both Negroes and whites, in each period, except that in the 15 to 20 year period the reverse is true for the whites—due probably to the greater number of foreigners and to the greater opportunities for industrial employment in the North.

In cities of 25,000 or more inhabitants in the South, there were among Negro children 6 to 9 years of age, 24,134 not in school, forming 36.8 per cent of the Negro population of that age; of those 10 to 14 years of age, 16,982, or 20.8 per cent were not attending school; and of those 15 to 20 years of age, 95,778, or 79.2 per cent; making a total not in school of 136,894, or 49 per cent for the population 6 to 20 years of age. The corresponding percentages not in school for the North were 19.3 (as compared with 36.8 in the South), 8.7 (as compared with 20.8 in the South), and 77.3 (as compared with 79.2 in the South), or for the entire period, 57.9 (as compared with 49 in the South).

GENERAL CONCLUSION.

Reviewing the situation as a whole, while it is true that the proportion of Negro children not in school is large, not only in rural communities, but even in large cities; and although in the South, the proportion of Negroes not in school greatly exceeds the corresponding proportion of whites, still the data for school attendance presented in this chapter establishes the fact of rapid improvement in the condition of Negroes in the South. That there should have been an increase of 561,243 in the number of Negroes in school in the United States in 1910 as compared with 1900, while the increase in population of corresponding age was very slight, is important; that of this number 533,506 should be in the South, including 216,872 children 5 to 9 years of age, is most significant. Should the next census show a similar advance, the Negro race in its school attendance will not stand far behind the white.

SCHOOL ATTENDANCE.

CHAPTER XVI.—ILLITERACY.¹

ACHIEVEMENT OF LITERACY BY THE NEGRO POPULATION.

A rapid decrease of Negro illiteracy during recent decades is the outstanding fact in the statistics for this class of population. This decrease is an index of improvement throughout the South in facilities available for the common-school education of Negroes and of a general appreciation of the value of literacy as a means of social advancement and efficiency in even the commoner wage-earning occupations.

In considering the data of illiteracy, it should be borne in mind that the percentage of illiteracy for the Negro population as a whole, as for any other class, can respond but slowly to improvement in educational conditions. If, for example, present school facilities throughout the country were to be so improved as to insure ultimate equality of condition as regards literacy between the several classes of whites and the Negroes, a period of half a century or longer would be required to establish that condition of equality in the adult population. Such an extended period would be required because obviously an improvement in school facilities could not materially affect the condition of the adult population except in proportion as that population, naturally reduced in the course of years by mortality, was gradually succeeded by generations of equal literacy.

The manifest improvement in literacy of the adult Negro population indicates, therefore, that improvement of common-school educational facilities has been in progress for a period sufficient materially to affect the entire population of all ages; and an analysis of the returns by age indicates further that the improvement already achieved generally throughout the South, if it is maintained, even without further advance, is certain materially to reduce below its present rate the illiteracy of the Negro population. The process of becoming literate is only partially completed. Present conditions and the improvement which has taken place in recent decades give adequate assurance that excessive illiteracy will in the near future cease to be a characteristic of the Negro population. At the close of the Civil War this class of the population was almost entirely illiterate and

the achievement of general literacy in a period of four or five decades is a fact of immense social importance not only for the Negro race, but as well for the whole community. It is an achievement in part national and in part local of the Negro race, and in a larger sense of the American democracy embracing all racial elements in the population.

DEFINITION OF ILLITERACY.

The basis for the classification of persons as literate or illiterate adopted at the last census, as at previous censuses, was ability to write in some language, irrespective of ability to read, and the inquiry was confined to persons 10 years of age or over. Persons of that age who, as reported by the enumerators, were able to write, whether in English or in some foreign language, were classed as literate, while those who could not write, even though they could read, were classed as illiterate.

ACCURACY OF DATA.

It will be obvious that in securing replies to this inquiry there is opportunity for error. Illiterates may naturally in some instances be unwilling to admit that they can not write and in certain cases the enumerator may be unable to determine the fact of literacy or illiteracy. In general, moreover, enumerators are under some temptation to assume literacy or illiteracy and to make an entry on the schedule without taking the trouble to ask the question covering the entry, with the result that in some cases illiterates are returned as literates or literates as illiterates. It is not improbable that in certain sections of the South white enumerators have been inclined to assume, where specific answers were not obtained to the inquiry, and especially where the person enumerated was not directly interrogated, that whites were able and that Negroes were unable to write, and thus to class the former as literate and the latter as illiterate. In the nature of the case there is no way of determining the margin of error in the returns, but examination and analysis of the returns at different censuses and of those for different sections of the country lead to the conclusion that the figures as given represent fairly the degree of illiteracy characterizing the Negro population of the United States at the present time, as well as the increasing literacy of that class in recent decades.

¹ For data relating to illiteracy in the black and mulatto population, see section "Illiteracy of blacks and mulattoes" in Chapter XI, p. 217, and Table 21 of that chapter.

NEGRO POPULATION.

ILLITERACY BY CLASSES.

The whole number of persons 10 years of age and over enumerated at the census of 1910 and the number in this adult population who were reported as unable to write are given in Table 27, page 428, by divisions and states, for the Negro population and for classes of the white population and are given in greater detail as regards race, nativity, and parentage in the following table for the United States as a whole.

Table 1

RACIAL CLASS.	POPULATION 10 YEARS OF AGE AND OVER: 1910.

¹ Less than one-tenth of 1 per cent.

The total number of persons in the United States 10 years of age and over reported in 1910 as illiterate was 5,516,163, or 7.7 per cent of the entire population of that age. Of this number 2,227,731 were Negroes, constituting 30.4 per cent, or nearly one-third, of the Negro population of that age. In 1910 Negro illiterates constituted 40.4 per cent of the illiterate population of the country, while the entire Negro population 10 years of age and over constituted only 10.2 per cent of the total population of that age.

Comparing the figures for Negroes with those for other classes, it appears that but 5 per cent of the whites were classed as illiterates; and that of these the foreign-born whites furnished the majority in numbers, and a much larger proportion relatively to the total number foreign born, than did the native whites relatively to the total native white population, the proportion illiterate among foreign-born whites being 12.7 per cent and among native whites 3 per cent. Excepting the Indians, the percentage illiterate for the Negro population exceeded that for any other of the principal population classes.

The excess of Negro illiteracy over the illiteracy of the white population was, however, markedly less in 1910 than it was at either of the two preceding censuses. While the total Negro population 10 years of age and over increased from 5,328,972 in 1890 to 6,415,581 in 1900 and to 7,317,922 in 1910, the number of illiterates in this adult Negro population, as shown in Table 2, decreased from 3,042,668 in 1890 to

2,853,194 in 1900, and to 2,227,731 in 1910, or in terms of percentage from 57.1 per cent in 1890 to 44.5 per cent in 1900, and to 30.4 per cent in 1910. In the same period the percentages for the white population decreased from 7.7 in 1890 to 6.2 in 1900, and to 5 in 1910; the excess of the percentage for Negroes over that for whites being thus reduced from 49.4 in 1890 to 25.4 in 1910.

Table 2

RACIAL CLASS.	ILLITERATES IN THE POPULATION 10 YEARS OF AGE AND OVER.

Other classes.....	103,799	126,126	69,460	31.6	44.5	45.2

¹ Exclusive of population specially enumerated.

The figures given in Tables 1 and 2 indicate clearly, first, that the illiteracy problem of the United States is very largely a Negro problem, since approximately two-fifths of the illiterates in the country as a whole in 1910 were Negroes; and, second, that as regards this element of the population, the problem is in a fair way of solution, since the increase in literacy among Negroes has been exceedingly rapid in recent years.

SEX AND AGE.

The illiteracy of the Negro population 10 years of age and over, classified by sex and age periods, is given for states in Table 24, page 420, and in somewhat greater detail as regards age in Table 3, following, for the United States as a whole.

The percentage illiterate among Negro males is practically identical with that for females, being 30.1 for males, as compared with 30.7 for females. The difference in these percentages represents an excess of females over males of 35,731 in the illiterate population. The differences between the percentages for males and those for females in the several age periods are, however, much more considerable than the difference shown for the total population 10 years of age and over.

Since the literacy of any community is determined by its educational facilities, where such facilities are deficient, or are of recent establishment, there is a corresponding degree of illiteracy. As is set forth in the chapter on school attendance, there has been a marked increase since 1890 in the number of Negroes attending school. Prior to that date, except in the North and in some limited districts of the South, there were comparatively few educational facilities

within reach of the Negro population; and even yet, these facilities are in some sections of the South comparatively meager, whether reference be had to the number of schools, the grade of instruction, or the duration of the school term. The percentage of illiteracy is correspondingly high among this class of the population, and higher among those whose youth antedates the development of educational facilities in recent decades, than it is in the younger generations. This is illustrated in Table 3, which shows that the lowest percentage of illiteracy—18.9—is for the age period 10 to 14 years, and that the percentage increases, with advancing age, the increase becoming especially marked for the age periods including those whose youth coincided in general with the era of reconstruction in the South.

It will be noted that the advance in the percentage illiterate from age period to age period is especially marked in the case of females; the percentage for females in the younger ages—10 to 24 years—being lower, and in the more advanced ages—25 years and over—higher, than for males. For the age period 10 to 14 years, for example, the percentage illiterate was 21.7 among males and 16.1 among females, while for the age period 55 to 64 years the percentage was 55.5 for males and 72 for females. In general, it is true that Negro women past middle age are more illiterate than Negro men, but it would appear that Negro girls and younger women have received at least such elementary school training as is represented by the ability to write, more generally than have Negro boys and young men.

DECREASE: 1890-1910.

The collection of statistics of illiteracy was begun by the Bureau of the Census in 1840 and has been continued at each succeeding census. The returns for the censuses for 1840, 1850, and 1860 were, however, so inaccurate, and those for 1870 were so differently classified, as to make satisfactory comparisons with recent censuses impracticable. In the census of 1880, the Negroes were combined with Indians, Chinese, Japanese, and other colored, in the compilations regarding illiteracy, thus impairing the comparability of the statistics for 1880 with those for succeeding census years. In the present report, therefore, compilations comparing 1910 with earlier years are limited to the statistics of the last three censuses.

Attention may, however, be called to one or two facts of interest that appear from the earlier censuses. In them returns were made for the free Negroes on essentially the same basis as for the whites. In 1850 there was a total free Negro population 20 years of age or over of 219,520, and of these, 90,522, or 41.2 per cent, were reported as unable to read and write, leaving nearly 60 per cent in the literate class. There

were 113,629 free Negroes in the South, and of these, 49 per cent, or approximately one-half, were literate.

The censuses of 1890 and 1900 were on the same basis as that of 1910, and Table 4 gives for these three censuses the number and percentage illiterate for the Negro population, by sex and age periods. Diagram I (p. 406) represents the percentages of Table 4 for both sexes combined.

In 1890, 39.8 per cent of the Negro population 10 to 14 years of age were illiterate; in 1900, 30.1 per cent, and in 1910, 18.9 per cent. Thus, for the Negroes of this age, the proportion illiterate decreased in the 20 years from nearly two-fifths to less than one-fifth. In the case of males 10 to 14 years of age the percentage illiterate was 41.9 in 1890, 33.5 in 1900, and 21.7 in 1910; and in the case of females, 37.7 in 1890, 26.8 in 1900, and 16.1 in 1910. A similar decrease from census to census is shown for the older ages.

At each of the earlier censuses as well as at the census of 1910 the percentage illiterate advanced with age. Comparing the ages 10 to 14 years and 65 years and over, for example, the advance for males was in 1910, as has been noted, from 21.7 to 70.7; in 1900 it

NEGRO POPULATION.

was from 33.5 to 83.6, and in 1890, from 41.9 to 88.3; for females the corresponding advances were for 1910, from 16.1 to 78.6; for 1900, from 26.8 to 87.2; and for 1890, from 37.7 to 92.1.

1890.....	23,738	10,953	12,785	66.3	59.4	73.6

¹ Figures for 1890 are exclusive of illiterate persons in Indian Territory and on Indian reservations specially enumerated but for which illiteracy statistics are not available.

In the Negro population 10 years of age and over as a whole, the percentage of illiteracy among females exceeded that among males by 5.4 in 1890, by 2.7 in 1900, and by only 0.6 in 1910. This approach to a condition of equality as regards illiteracy among males and females was, however, more apparent than real. In the Negro population 10 to 14 years of age, for example, the percentage of illiteracy for males exceeded that for females in 1910 by 5.6; in the population 15 to 19, by 8.9; and in the population 20 to 24, by 4.6. In the older age groups the percentage for females exceeded that for males, the differences in the percentages being, in the population 25 to 34 years of age, 0.3; in the population 35 to 44, 9.4; and in succeeding age groups 17.4, 16.5, 7.9, and 16.7, respectively. In five of the eight age groups shown the differences were less in 1910 than in 1900, but in the case of three age groups the differences were greater in 1900.

Changes in the proportion illiterate from census to census, and differences in the proportion from age to age, with the excess of males or females among illiterates of each age, are shown in Diagram II.

DIAGRAM I.—PERCENTAGE ILLITERATE, BY AGE PERIODS, FOR THE NEGRO POPULATION: 1910, 1900, AND 1890.

Although the Negro population 10 years of age and over increased during the decade 1900-1910 by 902,341, the number of illiterates decreased by 625,463. The population increase for the preceding decade amounted to 1,086,609 and the decrease in number of illiterates to 189,474. Classified by age, the Negro population in each age group increased and the number of illiterates decreased during the decade ending in 1910. In the decade preceding, also, population increased, and the number of illiterates decreased in each of the age periods comprising the population under 45 years of age—both population and the number of illiterates showing increases for the more advanced age periods. These absolute increases and decreases are shown in Table 5.

Table 5

DIAGRAM II.—PERCENTAGE ILLITERATE BY AGE PERIODS, FOR NEGRO MALES AND FEMALES, WITH EXCESS OF MALES OR FEMALES AT EACH AGE: 1910, 1900, AND 1890.

ILLITERATES PER 1,000 POPULATION.

The decreases from census to census in the percentage illiterate for the total Negro population 10 years of age and over, and for each of the several age groups shown in Tables 4 and 5, may be stated as decreases in the number of illiterates per 1,000 population, as in Table 6.

CENSUS YEAR.	NEGRO POPULATION.								
	10 years of age and over.	10 to 14 years.	15 to 19 years.	20 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.
1910.....	304	189	203	239	246	323	470	630	745
1900.....	445	301	218	351	393	520	681	754	854
1890.....	571	398	426	493	568	705	806	863	902
	DECREASE IN NUMBER OF ILLITERATES PER 1,000 POPULATION.								
1890-1910.....	267	209	223	254	322	382	338	233	157
1900-1910.....	141	112	115	112	147	197	211	154	109
1890-1900.....	126	97	108	142	175	185	127	79	48

In 1890 the number of illiterates per 1,000 Negro population 10 years of age and over was 571; in 1900 it was 445; and in 1910, 304. The decrease in the number of illiterates per 1,000 population amounted to 126 in the decade 1890-1900 and to 141 in the following decade—the total decrease for the 20 years 1890-1910

amounting to 267 per 1,000 population. In 1890, 398 per 1,000 Negro population 10 to 14 years of age were illiterate; in 1910, 189 per 1,000, the decrease in the number of illiterates per 1,000 population of this age amounting to 209 for the 20 years. In 1890, 902 per 1,000 population 65 years of age and over were illiterate, the proportion for this age group in 1910 being 745, and the decrease for the period, 157. Corresponding decreases are shown in Table 6 for each of the other age periods.

RELATIVE DECREASE OF LITERATES AND ILLITERATES IN SPECIFIC AGE GROUPS.

It is of interest to note that, as regards the individuals composing, respectively, the several age groups in 1890, the proportion illiterate among the survivors has decreased from census to census. The persons who were 15 to 24 years of age in 1890, for example, so far as they were still living at succeeding censuses, were 25 to 34 years of age in 1900 and 35 to 44 in 1910. The percentage illiterate for this group of individuals decreased from 45.7 in 1890 to 39.3 in 1900, and to 32.3 in 1910. In Table 7 the number and percentage illiterate among this group of individuals, classified by sex, is given as returned at each of the last three censuses, and corresponding data are given for other age groups. The proportion illiterate decreased in each decade among survivors, both male and female, for each age group.

NEGRO POPULATION.

1890.....	35-44	498,667	70.5	208,451	60.6	290,216	79.8
1900.....	45-54	420,438	68.1	191,883	59.3	228,555	77.8
1910.....	55-64	249,584	63.0	120,046	55.5	129,538	72.0
1900.....	15-24	652,610	33.4	338,976	36.3	313,634	30.8
1910.....	25-34	380,742	24.6	183,993	24.4	196,749	24.7
1910.....	15-24	460,720	22.0	253,429	25.6	207,291	18.8

While a few Negro illiterates may have left or entered the country during the 20 years 1890-1910, practically all of the 351,538 illiterates aged, for example, 35 to 44 years in 1910 were survivors of the 731,963 illiterates aged 15 to 24 in 1890. The decrease in numbers was, of course, due largely to mortality, but it was undoubtedly due in part to the fact that a certain number of these illiterates learned to write

during the period. The rate of mortality in the population 15 years of age and over may have been somewhat higher among illiterates than among literates, but it is improbable that the difference in mortality was sufficient to account for the entire decrease in the percentage illiterate, shown in Table 7. An obvious inference from the figures is that a certain number of illiterates 15 years of age and over in 1890 learned to write in the intervals between the censuses.

Exact figures as to the number emerging from the class of illiterates into the class of literates are not available. A comparison may, however, be made between the number actually reported in 1910 as illiterate and the number who would have been illiterate had the percentage of illiteracy among survivors remained constant. Computations based upon this assumption are presented in Table 8, by age periods, for the decade 1900-1910, which shows the decrease among survivors, classed as literate and illiterate, and the decrease in the number of illiterates which represents increasing literacy, i. e., the decrease in the number of illiterates which represents the decrease in the percentage illiterate among survivors.

1 A plus sign (+) denotes increase.

The total Negro population 10 to 14 years of age in 1900 was 1,091,990. The survivors of this group ten years later were included in the group 20 to 24 years

of age and numbered 1,030,795. Of the total number reported in 1900, 762,998, or 69.9 per cent, were classed as literate, and 328,992, or 30.1 per cent, as illiterate;

of the survivors in 1910, 784,935, or 76.1 per cent, were classed as literate, and 245,860, or 23.9 per cent, as illiterate. Thus in ten years the number of persons in this group, classed as literate increased—notwithstanding the losses by mortality—by 21,937, while the number of illiterates decreased by 83,132. In this group of individuals the number of literates increased 2.9 per cent during the decade 1900–1910 while the number of illiterates decreased 25.3 per cent. In the succeeding age group the number both of the literates and of the illiterates decreased, but the relative decrease was much greater in the case of the illiterates, being 41.7 for illiterates as compared with 10 per cent for literates. Similarly, as regards the more advanced ages, the percentage decreases were much higher for illiterates than for literates, the differences being so marked as to indicate, even for the more advanced ages, that a considerable number in these age groups learned to write in the interval between the censuses. This statement is true of both males and females.

Had the proportion of illiteracy among survivors of the group of individuals aged 10 to 14 years in 1900 remained unchanged during the decade 1900–1910, the proportion of illiterates in the population 20 to 24 years of age in 1910 would have been 30.1 instead of 23.9 per cent, and the number of illiterates would have been 308,558, instead of only 245,860, as reported in 1910. If it be assumed that the rate of mortality among literates was the same as among illiterates, the difference of 62,698 between these numbers represents approximately the number among survivors in 1910 who had been transferred from the illiterate to the literate class by reason of their having learned to write during the intervening decade. Similar calculations in regard to the other age groups show that the number who had, on the assumption made of equal mortality, passed from the illiterate to the literate class included 137,915 who were 15 to 24 years of age in 1900; 75,115 who were 25 to 34; 29,769 who were 35 to 44; and 20,470 who were 55 years of age and over; giving for the population 10 years of age and over in 1900 a total of 344,564.

ILLITERACY BY GEOGRAPHIC SECTIONS AND DIVISIONS.

In illiteracy, as in every other phase of Negro life in the United States, chief interest centers about conditions in the South. Of the 2,227,731 Negro illiterates in the United States in 1910, 2,133,961, or 95.8 per cent, were in that section of the country. The number and percentage illiterate in the Negro population at each of the last three censuses is shown by sections and southern divisions in Table 9.

The percentage illiterate for Negroes in 1910 was 33.3 in the South, against 10.5 in the North, and 7 in the West. Comparing the three southern divisions, the South Atlantic had the largest number of

illiterates but the lowest percentage, the percentage for the East South Central division being somewhat higher than that in the West South Central. In general, however, as regards the proportion illiterate, the situation is about the same in the three southern divisions.

1890.....	22,922	5,301	23.1

1 A plus sign (+) denotes increase.

In the South the percentage illiterate in the Negro population 10 years of age and over decreased from 60.7 in 1890, to 48 in 1900, and to 33.3 in 1910. During the 20 years under review, the Negro population of this age in the South increased 1,656,776, or 34.9 per cent, while the number of illiterates in the South decreased 749,255, or 26 per cent; in the North, population increased 310,666, or 56 per cent, the number of illiterates decreasing by 63,492, or 41.2 per cent; in the West, the population increase was 21,508, or nearly 100 per cent, the decrease in the number of illiterates being 2,190, or 41.3 per cent. In this 20-year period the South Atlantic division showed an increase of 682,761, or 29.6 per cent, in the Negro population 10 years of age and over, and a decrease of 415,200, or 30 per cent, in the number of illiterates included in that population; the East South Central showed a population increase of 459,468, or 30.6 per cent, and a decrease in the number illiterate of 241,157, or 26.1 per cent; the West South Central, a population increase of 514,547, or 54.4 per cent, and a decrease of 92,898, or 16.1 per cent, in the number of illiterates. In the North and in each of the southern divisions the decade 1890–1900 showed greater increases in population and smaller decreases in the number of illiterates than the decade 1900–1910, probably due in part to an undercount of population and of illiterates in 1890. It is, however, clear that progress as regards

NEGRO POPULATION.

literacy was uninterrupted during this entire period, and it is certainly a fact significant of educational progress in the South that during the single decade 1900-1910 in this section of the country the number of illiterates in the Negro population 10 years of age and over should have decreased by 583,645, while the total population of that age increased by 743,564.

The decrease in the proportion illiterate, expressed as the number of illiterates per 1,000 population 10 years of age and over, is given in Table 10, by sections and southern divisions, for the period 1890-1910.

Table 10 ILLITERATES PER 1,000 NEGRO POPULATION 10 YEARS OF AGE AND OVER.

YEAR AND PERIOD.	The South.						
	United States.	Total.	South Atlantic divison.	East South Central divison.	West South Central divison.	The North.	The West.
1910.....	301	333	325	348	351	105	70
1900.....	445	450	471	492	480	182	131
1890.....	571	607	601	615	609	278	252
Decrease: 1890-1910....	267	274	276	267	278	173	162

In the 20-year period 1890-1910 the number of illiterates per 1,000 Negro population 10 years of age and over decreased in the South from 607 to 333, the decrease amounting to 274; the decrease in the North, from 278 to 105, amounted to 173; and the decrease in the West, from 252 to 131, amounted to 121 per 1,000 population.

In Table 11 the number and percentage of illiteracy is shown for Negro males and females for the nine divisions.

Table 11 NEGRO POPULATION 10 YEARS OF AGE AND OVER: 1910.

It has been noted that in the country as a whole in 1910 the percentage illiterate among Negro females was slightly higher than among Negro males—30.7, as compared with 30.1. A corresponding excess in the percentage illiterate for females over the per-

centage for males, though slight, nevertheless obtains in each of the nine geographic divisions, except in the East South Central division. In the three southern divisions, however, and in the South as a whole the percentages for males and for females are practically identical.

The number and percentage illiterate at each of the last three censuses and the decrease in the number of illiterates during the two decades—1890-1900, 1900-1910—are shown for the Negro population, classified by sex, in Table 12, for sections and southern divisions.

The most prominent fact shown in Table 12 is that in each section of the country the absolute decrease in illiteracy during the decade 1900-1910 greatly exceeded that during the decade preceding. This is undoubtedly due in part to the undercounting in 1890, but it seems clear from the data that, as compared with the decreases of the earlier decade, the decreases of the decade 1900-1910 were in fact much more considerable. It should be borne in mind that the sectional and divisional decreases shown in Table 12 were undoubtedly somewhat affected by migratory shifts of the population during the two decades.

For the South as a whole the total decrease in number of illiterates during the 20 years 1890-1910 amounted to 749,255; of this total, 165,610 is credited to the decade 1890-1900 and 583,645 to the decade following. The decrease in the decade 1890-1900 thus amounted to only a little over one-fifth of the total decrease in the 20 years. Of the decrease in the number of illiterate males in the South, less than one-fifth was in the earlier period, and of the decrease in the number of illiterate females, less than one-third. In the North the decrease during the earlier decade amounted in the case of both males and females to one-third of the total decrease. Only in the West—where the numbers are inconsiderable—was the decrease greater in the earlier decade. In each of the three southern divisions, also, both for males and for females, the larger decreases are those for the later decade. In the South Atlantic division only one-third, approximately, of the decrease in number of illiterate males and of illiterate females during the 20 years was in the earlier decade. In the East South Central division only approximately one-twelfth of the decrease in the number of illiterate males was in the first decade and less than one-fifth of the decrease in the number of illiterate females. In the West South Central division there was a small increase of 4,779 in the number of illiterate males in the decade 1890-1900, and a small decrease of 1,210 in the number of illiterate females; in the decade following the number of illiterate males decreased by 40,926 and of illiterate females by 55,541.

The decreases in the number of Negro illiterates during the decade 1900-1910 and the increases in the Negro population 10 years of age and over are shown in Table 13.

¹ Figures for 1890 are exclusive of illiterate persons in Indian Territory and on Indian reservations specially enumerated but for which illiterate statistics are not available.
² Increase.

Table 13	SECTION AND DIVISION.	INCREASE IN NEGRO POPULATION 10 YEARS OF AGE AND OVER, 1900-1910.		DECREASE IN NUMBER OF NEGRO ILLITERATES, 1900-1910.	
		Male.	Female.	Male.	Female.
		United States.....	455,736	446,605	275,432
The South.....	374,729	368,835	255,070	328,575	
South Atlantic.....	167,568	163,535	122,053	158,794	
East South Central.....	77,369	80,701	92,091	114,240	
West South Central.....	129,792	124,599	40,926	55,541	
The North.....	71,289	69,020	20,124	21,406	
The West.....	9,718	8,750	238	50	

In each section and division shown in Table 13 the number of Negro males and of Negro females 10 years of age and over increased during the decade 1900-1910, while the number of illiterate males and females de-

creased. The decrease in the number of illiterates was greater in the case of females than of males, both in the South and in the North, the numbers in the West being inconsiderable. In the South, while the number of males increased by 374,729, the decrease in the number of illiterate males amounted to 255,070; for females, the population increase amounted to 368,835 and the decrease in the number of illiterates to 328,575. In each of the three southern divisions corresponding increases and decreases are shown, the decrease in illiteracy being in each division greater for females than for males. These figures seem to indicate either a greater effort to overcome illiteracy on the part of females than of males, or better opportunities for females to acquire an elementary school training.

The number and percentage illiterate in the Negro population, classified by age, is shown in Table 14.

NEGRO POPULATION.

Approximately one-fifth (20.2 per cent) of the Negro children 10 to 14 years of age in the South were illiterate in 1910, the proportion illiterate among Negro children of this age in the North being only 1.7 per cent and in the West, 1 per cent. Comparing age periods, the percentage of illiteracy increases with age, in each of the several sections and divisions, advancing rapidly after the 25 to 34 age period. The percentages for the several age periods do not show any marked divergencies from division to division in the South, those for the South Atlantic and West South Central being generally somewhat lower than those for the East South Central division.

In Table 15 the percentage illiterate in 1910 in the Negro population, classified by age, is given for sections and for each of the nine divisions, the percentages for the sections and for the three southern divisions being repeated from the preceding table.

In each of the nine divisions the percentage of illiteracy increases with age; in New England, for example, the increase was from 0.4 per cent for those aged 10 to 14, to 25 per cent for those aged 65 years and over, and corresponding increases may be noted for other divisions. The adult Negro population of the North and West is to a greater or less degree composed of migrants from the South, and to the extent that it is so tends to reflect the high rates of illiteracy which are and have been in the recent past prevalent in the South. It is, however, probably true that the proportion illiterate among adult Negroes who migrate from the South to the North and

West is lower than it is in the nonmigrant population of the South, and this may account in part for the fact that the percentages shown for the Negro population of advanced age in the North and West are lower than those for the population of the same age in the South.

In Table 16 the percentage of illiteracy is shown for the Negro population, classified by sex and age, for the two census years 1910 and 1900.

Taking the Negro population 10 years of age and over, as a whole, the difference between the sexes, as regards the percentage illiterate, was less in 1910 than in 1900 in each section of the country.

The percentage illiterate for females exceeded that for males in the South by 2.6 in 1900 and by only 0.4 in 1910; in the North, by 1.9 in 1900 and by 1.2 in 1910; in the West, by 3.4 in 1900 and by 2.1 in 1910. As has been noted with reference to the country as a whole, however, the differences between the percentages for males and those for females are generally more considerable in the several age groups than they are for the total population 10 years of age and over. In the South, as a whole, the percentage illiterate in 1910 was greater for males than for females in the ages 10 to 14 and 15 to 24 years, nearly the same for males as for females in the ages 25 to 34 years, and greater for females than for males in the more advanced ages. In 1900, also, a smaller proportion of females than of males in the younger ages—10 to 14 and 15 to 24 years—were illiterate, but the percentage illiterate among females aged 25 to 34, as well as in the more advanced ages, was markedly in excess of the percentage for males.

The number of illiterates of each race at the censuses of 1890, 1900, and 1910, and the percentage illiterate in each section of the country, are given in Table 17. The table embraces two arrangements of the percentages, in order to facilitate a comparison, first of one class with another class at the several censuses, and, secondly, as regards each class, a comparison of one year with another.

For each of the three classes in 1910 the percentage illiterate in the South exceeded the corresponding percentage in both the North and the West, being for the Negroes 33.3 in the South, as compared with 10.5 in the North and 7 in the West; for the native whites, 7.5, 1.2, and 1.4, respectively; and for the foreign-born whites, 18.8, 12.7, and 9.5, respectively.

Throughout the South at each census the number of Negro illiterates exceeded the number of white illiterates, although at each census the total number of white illiterates in the country, as a whole, exceeded the number of Negro illiterates, the excess of whites over Negroes being much greater in 1910 than in 1890. In the North and West Negroes constituted a small minority of the total number of illiterates in those sections. It is evident thus that the problem of Negro illiteracy is distinctively a southern problem.

The native whites everywhere show a diminishing number of illiterates from census to census, and this is true, also, of the Negroes, except in the West South Central division. The foreign-born whites, on

NEGRO POPULATION.

the contrary, show an increase from census to census in each section and division except in the East South Central division, in which this element of the population is numerically insignificant.

The extent of the absolute changes in the South may be briefly indicated. During the 20 years the total number of Negro illiterates in this section fell from 2,883,216 in 1890 to 2,133,961 in 1910, a decrease of 749,255, and the number of native white illiterates from 1,326,834 in 1890 to 1,079,583 in 1910, a decrease of 247,251; while the foreign-born white illiterates increased from 86,149 to 130,823, an increase of 44,674.

In 1890 the illiterate Negroes constituted 67.1 per cent of the total number of illiterates in the South, against 30.8 per cent for the native whites, while in 1910 the percentages were, for the Negroes, 63.8 and for the native whites 32.3. In this period the percentage illiterate for Negroes fell in the South from 60.7 in 1890 to 33.3 in 1910, the decrease in the percentage amounting to 27.4, the corresponding decrease in the percentage for the native whites from 14.8 to 7.5 amounted to 7.3. The percentage illiterate for the foreign-born whites increased slightly

but did not change materially during this period, being 17.1 in 1890 and 18.8 in 1910.

The percentage illiterate in 1910 among Negroes, native whites, and foreign-born whites is given in Table 18, by age periods, and represented graphically for the South on Diagram III (p. 413).

In the South as a whole, while the percentage illiterate increases with advancing age for both Negroes and native whites, that for the foreign-born whites remains unchanged for the first two periods and thereafter diminishes with advancing age, seeming to indicate that the older and earlier immigrants were—as compared with the younger and later comers—of a somewhat higher grade of intelligence. In the North the percentages for all three classes at each age are smaller than in the South, except that for the age 65 years and over the percentages for the foreign-born whites are nearly the same in the two sections. In each of the southern divisions the percentages for both Negroes and native whites are in general accord with those for the South as a whole, showing no marked divergencies, although those for the East South Central are somewhat higher than those for the other two divisions.

ILLITERACY BY STATES.

Statistics of Negro illiteracy in the several states are set forth in Tables 23, 24, 25, 26, 27, and 28 (pp. 419 to 429). In each of the states the percentage of illiteracy in the Negro population decreased during the decade 1900-1910, and in each of the states except Montana—in which the Negro population 10 years of age and over was numerically insignificant—the percentage decreased in the preceding decade also. Thus in practically every state the percentage of illiteracy among Negroes declined during the 20 years covered by the data. In each of the Southern states, except Oklahoma, and in each of the Northern states, with

inconsiderable exceptions, the number of Negro illiterates, as well as the percentage illiterate, decreased during the last decade. In Oklahoma, although the number of Negro illiterates increased from 881 in 1890 to 14,870 in 1900 and to 17,858 in 1910, the percentage illiterate in the Negro population 10 years of age and over decreased from 39 in 1890 to 37 in 1900 and to 17.7 in 1910, the increase in the number of illiterates in this state being attributable to migration of illiterates into the state.

In 1910 the illiterate Negro population of Georgia exceeded that of any other state, the number of Negro illiterates reported from this state being 308,639. Other states reporting more than 100,000 illiter-

ates were: Alabama, 265,628; Mississippi, 259,438; Louisiana, 254,148; South Carolina, 226,242; North Carolina, 156,303; Virginia, 148,950; and Texas, 124,618.

The percentage of illiteracy is given, by states, in Table 19 for the Negro population at each of the last three censuses and for the native and foreign-born white population in 1910. In this table the states are ranged in order according to the percentage of Negro illiteracy in 1910.

¹ Percentages for 1890 do not include illiterate persons in Indian Territory and on Indian reservations, area specially enumerated, but for which illiteracy statistics are not available.
² Includes population of Indian Territory for 1900.

Nearly one-half of Louisiana's Negro population 10 years of age and over in 1910 was illiterate, the percentage of illiteracy being 48.4. In Alabama, the state showing the next largest proportion, 40.1 per cent, or two-fifths, were illiterate. The lowest per-

centage shown by any Southern state in 1910—i. e., Oklahoma's percentage of 17.7—exceeds slightly the highest of the percentages shown for Northern and Western states, in several of which Negro illiteracy in 1910 amounted to less than 5 per cent.

In 13 of the 16 Southern states half or more of the Negro population 10 years of age and over was illiterate in 1890; the percentage illiterate in Delaware, one of the three remaining states, being 49.5. The percentage of Negro illiteracy in Louisiana in 1890 was 72.1; and in Alabama, 69.1. In 1900, 4 states showed a percentage of 50 or more, the highest percentage for any state in this year being again that for Louisiana, 61.1. In 1910 no state reported a Negro illiteracy amounting to 50 per cent, the highest proportion illiterate for any state being 48.4 per cent.

The percentage of illiteracy among foreign-born whites in 1910 exceeded that among Negroes in 27 states.

Statistics for the several states, showing illiteracy among the Negro population by age periods, are given in Table 24, page 420. In the Southern states the only exception to the general rule that illiteracy advances continuously from age period to age period is found in Arkansas, where the percentage of illiteracy for Negroes 15 to 24 years of age is practically identical with the percentage for those aged 10 to 14 years. In several Southern states four-fifths or more of the Negro population 65 years of age and over were illiterate, the lowest percentage illiterate in the population of this age for any Southern state being 65.2 for West Virginia.

The higher percentages for the older ages, as has been pointed out, reflect educational conditions which do not generally obtain in the South at the present time. As indicative of present conditions, statistics for the younger ages arc of special interest, and in Table 20 statistics are given, by states, for children 10 to 14 years of age, showing the number and percentage illiterate in 1910 and in 1900 for Negro children, and the percentage illiterate in 1910 for native and foreign-born white children of this age. The states have been arranged in order according to the percentage illiterate for Negro children in 1910.

More than two-fifths of the Negro children 10 to 14 years of age in Louisiana were illiterate in 1910. The percentage illiterate for these children had decreased during the decade from 49.7 to 41, but in 1910 was still greatly in excess of the percentages shown for Negro children in other Southern states, and more than twice the percentage for such children in the South as a whole.

Marked decreases in the proportion illiterate among Negro children in the Southern states generally are shown for the decade 1900-1910. In Alabama, for example, the proportion decreased from 44.6 per cent

NEGRO POPULATION.

in 1900 to 27.5 in 1910; in South Carolina, from 38.8 to 23.1; in Georgia, from 36 to 22.1; in North Carolina from 31.3 to 16.6. The lowest percentages in 1910 for Southern states were those for West Virginia, 6.4; Delaware, 6.3; and Oklahoma, 6.2.

In the Northern and Western states generally illiteracy among Negro children 10 to 14 years of age in 1910 amounted to less than 2 per cent, and in a number of these states it was only a fraction of 1 per cent.

ILLITERACY AMONG NEGRO AND WHITE CHILDREN 10 TO 14 YEARS OF AGE, BY STATES.

URBAN AND RURAL ILLITERACY.

Statistics of illiteracy for the Negro population, classified as urban and rural, are given in Tables 28 and 29 (pp. 429 and 430), and for individual urban communities in Tables 30, 31, and 32 (pp. 432 to 435).

Among Negroes, as among whites, the proportion illiterate in the rural population exceeds that in the urban population. In 1910, of the 2,227,731 Negro illiterates, 1,834,458 were in rural communities and 393,273 in urban communities, the percentage illiterate being 36.1 in the rural and 17.6 in the urban Negro population 10 years of age and over. Approximately one-fifth of the urban Negro population in the South were illiterate in 1910, the percentage illiterate in the three southern divisions being in the South Atlantic division, 21.4; in the East South Central, 23.8; and in the West South Central, 20.3. The corresponding proportions for the rural Negro population in these divisions exceeded one-third, being 36.1, 37.8, and 37.2 per cent, respectively. In the northern and western divisions the proportion illiterate for the urban Negro population ranged from 5.3 per cent in

the Pacific division to 12.3 per cent in the West North Central, and in the rural Negro population, from 10.6 in the Mountain to 21 in the West North Central division. The number and percentage illiterate in the urban and rural population are shown in Table 21, for the several sections and divisions.

At the last census the percentage illiterate in the rural Negro population of each state, with exception of New Hampshire and Wyoming, exceeded the corresponding percentage for the urban population. In Louisiana 55.8 per cent of the rural Negro population was illiterate, the percentage for the urban population of this state being 25.8. In Alabama the percentages were 43.5 for the rural population and 26 for the urban; in South Carolina, 40.2 and 29.6, respectively; in Georgia, 39.7 and 24.9. Oklahoma's percentages—19.9 in the rural and 12.4 in the urban population—were lower than those of any other Southern state. In the Northern and Western states the percentages ranged in the rural Negro population from 1.5 in Wyoming to 25.2 in Missouri; and in the urban population, from 2.7 in Minnesota to 13.9 in Missouri.

ILLITERACY IN CITIES.

In general, it is true of the principal urban communities that the proportion illiterate in their Negro population tends to be relatively high or low, according as the percentage for the Negro population of the state or section in which the city is located is high or low, the percentages being relatively high for southern cities and low for northern and western cities. There is, however, no uniform close correspondence of the percentages for individual cities to that for the urban population as a whole of the state or section in which the city is located. In the case of the larger cities with considerable Negro populations, the percentage of illiteracy is generally, but not in every instance, below the percentage for the urban population of the state in which the city is located. Probably the explanation of this is that conditions in the smaller urban communities approximate those in distinctly rural communities where illiteracy is in general high. Of the Negro population of New Orleans, for example, 18.3 per cent were illiterate in 1910, while the percentage for the urban Negro population of Louisiana as a whole was 25.8; the percentage for Atlanta was 20.9, and for the urban population of Georgia 24.9; for Birmingham, 22.1, and for the urban population of Alabama, 26; for Baltimore, 13.2, for the urban population of Maryland, 14.9; for New York City, 3.6, and for New York state urban, 4.2. In the case of Nashville, Tenn., on the other hand, the percentage of illit-

eracy for the Negro population (22) exceeded that for the urban Negro population of Tennessee (20.7), and it is true in the case of a few other large cities that the percentage of illiteracy among Negroes is somewhat above that for the urban Negro population as a whole.

The relatively low illiteracy of the urban population as a whole and of the larger urban communities in particular, in comparison with the illiteracy of rural districts, may be accounted for in part by the fact that the school facilities provided in urban communities have been superior to those provided in rural districts, and in part to the fact that the percentage of illiteracy among Negroes who migrate from country to city is probably lower than it is among those who remain permanently in the country.

In the cities as in the states, the percentage illiterate advances with age. Of the Negro population 10 to 14 years of age in New Orleans, for example, only 6.5 per cent were illiterate, the percentage for those 65 and over being 57.8; the corresponding percentages for the Negro population of Atlanta were 6.2 and 76.8; for Baltimore, 2 and 46.5; for Birmingham, 6.7 and 72.8; for Louisville, 1.1 and 70; for Memphis, 6 and 65.7; for Nashville, 4.7 and 77.9; for Richmond, 6 and 65.9; for Washington, D. C., 0.9 and 59.7.

In all of the principal cities the proportion illiterate in the Negro population decreased rapidly during the two decades 1890-1910. The decrease in Birmingham, for example, was from 51.5 in 1890 to 22.1 in 1910; in Atlanta, from 48.9 in 1890 to 20.9 in 1910; in Rich-

mond, from 45.7 to 19.6; in Nashville, from 45.4 to 22; in Memphis, from 44.2 to 17.6; in New Orleans, from 43.1 to 18.3; in Louisville, from 41.8 to 18.7; and was equally marked in other urban communities.

ILLITERACY AMONG MALES 21 YEARS OF AGE AND OVER.

Statistics of illiteracy for Negro males 21 years of age and over are given, by states, in Table 24 (p. 420); and for urban communities in General Table I (p. 767); and for counties in General Table III (p. 798).

In 1910 Negro males of this age numbered 2,458,873, and of this total, one-third—819,135, or 33.3 per cent—were illiterate. In 1900 illiterate Negro males 21 and over numbered 976,610, giving a percentage of illiteracy of 47.4. During the decade 1900-1910 the number of Negro males 21 and over increased by 398,571, the number of Negro illiterates of this age decreasing in the same period by 157,475.

For this class of the population, a summary of the statistics of illiteracy is given in Table 22, by sections and southern divisions.

SECTION AND DIVISION.	Negro, 1910.		Percentage illiterate.				
	Total.	Illiterate.	Negro population.		White population, 1910.		
			1910	1900	Total.	Native.	Foreign born.
United States.....	2,458,873	819,135	33.3	47.4	5.8	3.5	11.9
The South.....	2,086,639	777,181	37.2	51.9	8.9	8.4	16.1
South Atlantic.....	955,364	351,220	36.8	51.1	8.9	8.6	13.0
East South Central.....	642,460	232,677	36.3	53.6	10.6	10.7	7.8
West South Central.....	488,815	173,284	35.4	51.0	7.5	6.0	21.1
The North.....	351,213	40,546	11.5	20.6	5.1	1.7	11.9
The West.....	21,021	1,408	6.7	13.4	3.8	1.2	9.3

Of Negro males of voting age in 1910, illiterates constituted in the South as a whole 37.2 per cent; in the the North, 11.5 per cent; and in the West, 6.7 per cent. The corresponding percentages in 1900 were 51.9, 20.6, and 13.4. In the South Atlantic division the percentage decreased from 51.1 in 1900 to 36.8 in 1910; in the East South Central division, from 53.6 to 39.3; and in the West South Central, from 51 to 35.4.

In Louisiana illiterate Negro males 21 and over numbered, in 1910, 84,176 and constituted 48.3 per cent, or nearly one-half of the Negro males of that age; in Alabama the number of Negro illiterates of this class was 92,744, giving a percentage of illiteracy of 43.4; in Georgia the number was 111,039, giving a percentage of 41.6; in Mississippi, 95,702, giving a percentage of 41. The lowest percentage shown for any Southern state was 20.1, the percentage for Oklahoma. Among Northern and Western states the percentage ranged from 3.1 in Oregon to 19 in Missouri.

Referring to the statistics for cities, it will be found that the percentage illiterate among Negro males 21 and over decreased in Atlanta from 38.3 in 1900 to 21.7 in 1910; in Baltimore, from 26.5 to 13.4; in Birmingham, from 40.2 to 23; in Louisville, from 35 to 20.3; in Memphis, from 37.8 to 16.4; in Nashville, from 36.5 to 25.3; in New Orleans, from 36 to 17.1; in Richmond, from 35.4 to 20.8; in Washington, D. C., from 26.1 to 13.8.

Among Negro males of voting age, the decrease in illiteracy in recent years has been rapid throughout all sections of the South, in both the urban and the rural population. This decrease has undoubtedly continued since the taking of the last census, and it is practically certain to continue in the future until the proportion illiterate among adult males approximates that among males in the younger ages.

ILLITERACY.

TABLE 23.—ILLITERATES IN THE NEGRO POPULATION, BY SEX, BY DIVISIONS AND STATES: 1910, 1900, AND 1890.

[Per cent not shown where base is less than 100.]
